

Tucker Adams - 00:25

That was good.

Michael Byers-Norton - 00:26

Same old sir. How you doing?

Tucker Adams - 00:28

Good.

Michael Byers-Norton - 00:30

Go camera list if you want.

Tucker Adams - 00:31

Here.

Michael Byers-Norton - 00:34

What is good with you?

Tucker Adams - 00:37

Getting back to it. Being very impressed with Claude once again.

Michael Byers-Norton - 00:43

Have you been tempted to try out the new GPT or new OpenAI product yet?

Tucker Adams - 00:49

Honestly, I'm pretty embedded with Claude at this point.

Michael Byers-Norton - 00:54

Yeah, same. But the hype is pretty loud for GPT6. Like somebody's been freaking out about it lately.

Tucker Adams - 01:01

Interesting. I haven't even been tuned in. All I saw was that it cracked some new like mathematical theorem that we've been sitting on forever.

Michael Byers-Norton - 01:10

Yeah. One of the clients of mine is just like, oh my God, it's amazing. Oh my God. Dude, I had no time to try this out.

Tucker Adams - 01:16

Interesting.

Michael Byers-Norton - 01:17

What are you doing with your day job? But yeah, so yeah, we'll see. But no, it's. I'm excited to get you back on that grind, man. Like it's for sure a lot been going down and it's timing's right for it. So. Trying to think about how to break the size and get back into the discussion here. Apologies for yawning. I was out way too late the last couple nights. I'm just still trying to reboot.

Tucker Adams - 01:43

Fun stuff.

Michael Byers-Norton - 01:45

Fun stuff. Like just stayed out late Saturday night just shooting pool at this new place. And so it was really nice to close that place out and talk myself into going to a late night DJ set on Sunday.

Tucker Adams - 01:59

Oh, all right.

Michael Byers-Norton - 02:01

So that was awkward, but at the same time awesome. Hadn't been to that style of event in a very long time. So it was a. I was in a sketch ass warehouse down in Globeville.

Tucker Adams - 02:13

That seems like the what you would anticipate for a late night DJ set.

Michael Byers-Norton - 02:19

Yeah, exactly. So it's first time doing a proper warehouse type of set that way. That was kind of cool. But it was up later than I'd been in a long time. So I did absolutely nothing yesterday except for just brain dead and watch a movie.

Tucker Adams - 02:33

Sure, sure.

Michael Byers-Norton - 02:34

But. All right, so where to? Jump in here. You took off like right when I was getting back from my little escape. I think that sounds right.

Tucker Adams - 02:47

Yep.

Michael Byers-Norton - 02:49

So I, when I came back, I was trying pretty hard to just, you know, help structure a scalable process of the team and just see if I can roll out roles and keep things moving in the right direction and mediocre success on that. Like was able to get pretty tight in line with Ruben almost right away, but wasn't able to really paint clear pictures or processes for Davis and Bobby. And so it was just a lot of cycles and effort Put into like what are we trying to scale, what are we trying to do? What are their roles type of dynamics. It was a good time for me just to revisit building out the models and just trying to figure out what we're trying to accomplish that way.

Tucker Adams - 03:29

Is there a three sentence version of what you landed on? A recent what abbreviated version of what you landed on in terms of each person's lane?

Michael Byers-Norton - 03:40

A little bit. I'm like realizing for Bobby it's like, dude, your hands are super full right now. Just focus on those. Like there's not enough room right now and enough money coming in. More importantly to be a proper executive in the company. Like there's not a path for that at the moment.

Tucker Adams - 03:59

Yeah.

Michael Byers-Norton - 03:59

And if I need to be comping you on cash coming in, then dude, go focus on killing these accounts and winning these two deals that are in the funnel like that are underneath your name. Like I can't be trying to put too much more through what you're doing right now just because it's shitty for me to even ask and not really viable when it comes down to it. So that's where just focus on what's coming out of at you and get her done type of vibe there. And then for Davis it's just like, dude, we're still in a catch all mode type of moment. Let's just keep figuring out how we can work together on what we're doing here. Your role is safe. You don't need to be like stressing right now.

Michael Byers-Norton - 04:43

But at the same piece, let's just keep exploring how you can fit in where we can fit in, what we're trying to accomplish. So there's a fair amount of neutral and wide open discussions that way. But it's just trying to get things to a cache based model that work where things have been interesting around that is we do have enough success popping up in the funnel right now to be intimidating that way. Like in a yo, there's a bunch of good coming in. Let's make sure we're stocking up our resources accordingly to go do it to execute on this property. And so that's kind of been a lot of the good outcome of it discussion wise and just trying to let's be straight up about these things.

Michael Byers-Norton - 05:28

But it highlights like the need for me to be able to deliver on bigger projects is crucial and the ability for me to step away from the work I'm doing is non existent. Like it's just I need to be involved in some shape or form to keep it on the rails and to keep adding that value to the clients at the end of the day.

Tucker Adams - 05:50

Yeah.

Michael Byers-Norton - 05:50

And so that brings it around to like where I'm at Zenwise this morning, which is like dude, let's we need to focus on this automation heavily. Like both from a, you know, just standardizing what we do perspective, but also like project management perspective heavily. Like just four of our big accounts are multi side accounts and these are developments with a ton of moving pieces. Gotta find a way to be organized and that's like front and center in my mind this week of just dude, if we focus on what's at our fingertips right now, we'll be in a great spot. And the optimization work that you're doing right now for like the product, the product reports, like we're going to need to

Discussion - 2026.09.08

have that internally. Like we should be using our methods and procedures on every site we touch and every site we believe in.

Michael Byers-Norton - 06:45

Why wouldn't we? And let's just make it so we can do that very effectively and efficiently. And then if somebody signs so there's cash involved with something great now we can throw hours at it and pay people like for grind, we can add resources to it. But until then we just need to be very efficient with our time. And like Automation have people who can then use those automated tools which is like where Davis pops into the picture and potentially Reuben pops in. But Ruben's a good one to put on as a proper retainer type of support person. So client facing, sales, engineering facing brings back tasks and then just have that as a cycle machine. Like everything still comes back to myself to if we're liable for a statement, until people get to that level, I'm the one being liable for statements.

Michael Byers-Norton - 07:32

And as long as we have that at my fingertips, like all of our research is going into one sharepoint or one Obsidian that can quickly get up to speed or read through the documents and quickly understand where we are. I think I can be rather dangerous supporting the current accounts that we have and accomplish a lot. So.

Tucker Adams - 07:53

That all makes sense. And sorry I stepped on the tail end of it, but my vision for this is to get it in a place where you can support more work, maybe a lot more work with just you. And so I'm continuing kind of one by one and I'm starting with a PSA to work through like that work through the automation of where does the information live publicly? How can we automate getting it onto a slide? I've been sending you a few more today on the power side. So that's like finding all of the transmission shapes and substation locations and information on those so that we can automate putting those on slides.

Tucker Adams - 08:44

And then I've mentioned this before, but to me the biggest risk of anytime you have Claude in a loop like this is it making things up or even if it is reporting accurate information, not being able to tell you where it came from. So the focus of the back end of this is to have a ledger is the word that we've used of all of the facts and figures that go into anything and the sources that they came from so that we're not making stuff up and that it is easy for you or others to verify all of the stuff that's going in there. And then some of the questions are largely about do we have like set rubrics for some of these more, I don't know, assessment based or interpretation based elements already.

Tucker Adams - 09:39

And then also how much interpretation do we want to ask Claude to do versus and have you check it versus just Claude don't do any interpretation, just get all of the information together and then Michael can take it from there. In terms of actually putting the report.

Michael Byers-Norton - 09:53

Together, I think in the right way, like and this is where my goal is to be. If I keep running full speed on projects that are at hand right now and both revenue generating projects and also accounts are bringing us portfolios, it's a way to polish in that rubric you're talking about per assessment because I make them all the time. Right now I just need to get that into a more dependable mode. So if I'm getting it into a dependable mode, kind of building out thesis behind it so we can defend it, I capture amount of fireflies as well. And then having, you know, working to make sure that's translating into the AI driver, you know, those markdowns I can do things against as well as the template for the deliverable or template for how we're keeping track of this internally.

Michael Byers-Norton - 10:41

I'm just trying to find a way to pull those pieces together properly.

Tucker Adams - 10:44

Yes.

Michael Byers-Norton - 10:45

The dream I have right now is like everything and I can get us time to review this with one of our colleagues already has this kind of working but like an obsidian vault for every project. And in there's a standard, you know, list of things that we usually want to capture per project. Like that's that framework we're talking about. Yeah. And so that would be just the data and knowledge framework part of it. So what's inbound Repository wise. So emails, documents provided, and then also AI research. So we can, you know, anything that we're doing research on, we should still at least have a resource on it at the moment that'll be part of our QA process, but then have the traditional terabyte assessments that we'd be doing.

Michael Byers-Norton - 11:28

So the four reports is a good example because those four questions are still like the basics we should be answering on every site we always touch, Right? Yeah. And if we just have that, always living in a Obsidian drive, the ability to then routinely produce summaries of that for getting me as the executive up to speed is a major goal.

Discussion - 2026.09.08

But then also a like, summary for tracker perspective. Like, hey, here's the statement that we're making. What resources are backing that up and ability to see that resource has been verified as real, not just AI slop. That's kind of where my head's at right now. From a. If we. Everything we're putting out there has to eventually be defended against, and we expect it to be defended against, then we should be preparing everything in that frame of mind.

Tucker Adams - 12:13

Let me ask you a clarifying question quickly. If we're talking about like the PSA report that I'm using as my current baseline, I. I've already identified, I think, well, I, slash Claude, have identified like 80 facts and figures that are already going into that. Which means that all of those have something behind them.

Michael Byers-Norton - 12:39

Yeah.

Tucker Adams - 12:40

The short condensed version is we build a single ledger. It has the fact that it has the figure, it has the source for that figure, and that's it. You build up basically a glorified CSV that has every piece of information and where it came from. That's a much smaller version. The other version is that in Obsidian we are saving the originals of all of these sources. It's not just like pointing to it is actually saving that original source.

Michael Byers-Norton - 13:15

Yes.

Tucker Adams - 13:15

Do you have a preference, strong feeling, whatever, one way or the other, dude.

Michael Byers-Norton - 13:22

Painfully. I want to do both. Right. I want to have that fast repository and then I want to have the aggregate of that information that flows into the cells that we use in that model. Okay, right. Like it's because. But that's a dream. Like, let's keep working on that together. I know what makes the most sense.

Tucker Adams - 13:39

There, but I don't think it's a significant shift. Like, the work is finding the correct sources and then interpreting them correctly into a report. At least on, like, on the cloud side. If, if we add the additional step in the middle of like, okay, actually save A copy of that. I don't think that's. I mean obviously it increases the data load significantly, but I don't think that is adding a lot of upfront work in creating this program.

Michael Byers-Norton - 14:10

I think we should. So the way I'm viewing like the bigger philosophical what we do perspective. Right. Like we have a very tactical machine on the feasibility point. That's the reports that culminate in the pasa, you know, those are all just helping make informed decisions. Yep. And then once a decision is made on a project, then we shift into delivery mode, which is where, you know, we know whoever's buying the site will have a full diligence team going through every item and statement we make looking for verification. That's where having that file that we be able to upload into a data. Yeah, that's a good goal, dude.

Tucker Adams - 14:46

It's most. Honestly the thing that I'm reflecting on right now is mostly that like even if it's just a versioning thing, you want to have the original that you looked at. If for no other reason than if some source updates, changes, whatever you can say, hey, there may be new information available that changes our answer. But weren't making it up. We weren't crazy when we put this thing down in the first place. It's a CYA as much as anything that makes sense. Honestly. This is getting way. Go ahead.

Michael Byers-Norton - 15:26

No, you're good. I was about g real.

Tucker Adams - 15:28

I was just gonna say this is getting way out of our excuse but I feel like if we put together the thing that we are talking about successfully, this is like a pretty significant tool.

Michael Byers-Norton - 15:43

Yeah.

Tucker Adams - 15:43

In a good way. I'm wondering if like this becomes differentiating to some extent. But I think that is a ways down the road. I think we, I think we build it to make our own jobs better and easier first and if we want to, you know, try to show it off for clients or something that comes down the road.

Michael Byers-Norton - 16:05

Yeah. The danger zone is the shop points like right now too. Like that's the hardest part of how do we pace this and how do I make sure you have the fuel and the fire to do what you need to do? Yeah, because it's happening, man. That. Because I think you're nailing the power of that program, which is also the power of getting the shit out of my head into a machine that can be translated effectively across cultures.

Tucker Adams - 16:28

Yeah.

Michael Byers-Norton - 16:29

And to the investment community, to the delivery community, to the end user community. And that's really what. That's our sweet spot. Right.

Tucker Adams - 16:36

Yeah.

Michael Byers-Norton - 16:37

And the more this turns into a platform that's where if this works as a machine, as a software and everything problem wise just turns into headcount. Like how can we train people up to use this and have a QA hierarchy in place to make sure the quality is there. But this is foundational for incredible scale, incredible impact period. Right. Like this is needed very badly right now. Yeah. And the. That's essentially it. Right. Like because that's where I'm hyped. That's where I'm very hyped.

Tucker Adams - 17:11

That makes sense. The. And the other thing just as I continue to think through this the way like a mini value of the Obsidian approach. Obsidian. Obsidian is that can also be where transcripts of like your riffs etc live.

Michael Byers-Norton - 17:31

Yes.

Tucker Adams - 17:32

So that just makes it a good repository for various types of information that we are collecting here.

Michael Byers-Norton - 17:38

Okay. Because so much that just lives in. Yeah, that just lives everywhere. So vision is addressed. Right.

Tucker Adams - 17:45

Vision is aligned. I think I'm just going to keep chugging away. I'm just going to keep pressing with Claude code is kind of a combination of, you know, working on the ability to make individual slides in the report just because that's an easy way to segment what capabilities we need it to have. Along with also taking a step away occasionally to do back end systems like okay, let's have a program that goes and checks to make sure that all of our sources that we have saved down are up to date. Right. Like we have a national database of transmission shape files. Every time we run a report we want this sub process to go check and make sure that file is up to date, etc.

Michael Byers-Norton - 18:30

Etc.

Tucker Adams - 18:31

So I will keep pushing on my end, I will continue sending fun outputs and then once we get to a good like once through or maybe even before then honestly there's going to be like once we get to a point where this program can make can generate anything that goes into a pasa, I also want to make sure that it is replicable across various sites etc. Obviously then there is a process. What am I looking formalization step as well, making it easy for others to pick up. So those are kind of the elements that are floating around for me on that front. Which brings us to New Edge company. It sounds like maybe some movement with the trickle point guys.

Tucker Adams - 19:29

And I guess the last thing that I will say on this ramble is I was thinking about new EdgeCo kind of the two business models that you wrote down. I think ultimately both of them come down to faith in our ability to execute, which leads to funding, which leads to our ability to have some kind of proprietary site access. Which is what daring keeps going back to over and over again. And it sounds like if the Triple Point guys are already, you know, expressing interest, we may have the, you know, the proof point, the faith in our abilities step covered. Which leads us to can we actually get money for this? Which leads us to can we actually go get sites for this? But that's the end of my rant. I'm interested to hear how you're thinking about it and what's the latest.

Michael Byers-Norton - 20:29

So the Triple Point partners guys, you know, I brought up to them what we're doing, I brought the high level. Here's what New Edge co we're trying to do is trying to figure this out because they're chasing everything in their dog. They're still in the identity phase, but they're wanting to put money to work. And so they're having real opportunities come across their plate already put money to work and then they're having, you know, opportunities that are more widespread. Like two of their accounts right now are small modular edge companies, one that owns the chips as well. So they're just looking to buy Powered land and the other one that's open for joint ventures and operational type of things. And that's just what they've created themselves. When I brought up New Edge Co.

Michael Byers-Norton - 21:11

They were like, hey, we have one of the guys who's pitching our sites constantly who wants our investments. He thinks he has a group that wants to play in this arena. They're sitting on half a billion dollars that needs to get spent and they believe in these smaller edge sites because they can connect the sites with each other with a D link which is the back plane interconnected tissue for the Nvidia platform.

Tucker Adams - 21:38

Okay.

Michael Byers-Norton - 21:38

Which is exactly my thesis previously that wavelengths platforms and those distances to each other so you don't have to amplify the signal will be the most economic and performance tiered connection between sites. So there are groups now officially putting money to that effort to buy up one to five megawatt sites and tape them together.

Tucker Adams - 21:55

And do you know at what stage of development they're looking for those sites? Like are they looking for, you know, sites that already have chips on them? Sites that are. Yeah, you got it.

Michael Byers-Norton - 22:09

It's just, it speeds chips, the speeds of the chips being live. So pre powered, pre zone entitled. They want, they want it all, they want it as quick as they can so they can pre lease and know that their workplace in my home. And so there he. He has an example of one of the like one and a half megawatt sites that he has right now. He has like five people bidding against each other on it. Yeah, it's getting surprising amount of attention for a ridiculously small site.

Tucker Adams - 22:34

Honestly, that's another thing that I. Oh, sorry. Go ahead.

Michael Byers-Norton - 22:37

You're good.

Tucker Adams - 22:38

I was just gonna say that was another thing that I thought about in terms of the, you know, having some kind of good line on site access is like as soon as something becomes too public, the site owner is going to be able to extract most of the value from it with exactly what you're saying, which is a bidding war for the people who are trying to get into it.

Michael Byers-Norton - 23:03

100. So what I'm trying to like New Edge co Edits base. If we put the effort into those accounts that own the land today, we can get premium control of the land, but they're unlikely to pay us cash money for that work as purely speculative work. And that's the truth right now for this current portfolio with Michael Rareshide, because they don't even have the budget to do audits on those sites. They want somebody to come in and just take them over. And so because it's a cost center today, they're trying to divest. They don't have a goal to get maximum value for it because that doesn't move the needle with who's in charge of that project right now.

Michael Byers-Norton - 23:42

So it's a good example of, you know, a lot of these carriers, we're gonna have to do work on spec to get those doors to open. But if we do, we're basically helping them be the vehicle for divestiture, which is exactly how Rare Shy came into that portfolio initially. It's also how Enabled Energy came into Lumen portfolio initially. So it's one of those things that we can keep pulling that lever, but it is speculative and it is dangerous. So it's. It's an interesting debate to have. That being said, for the Rare side portfolio right now, I sent them an email earlier today saying, hey, we want all 200 of your sites. Like, give us all of them. We want control of all of them. And the reason I'm pushing for this a bit more aggressively now is a twofold thing.

Michael Byers-Norton - 24:30

When I was reviewing this opportunity with Triple Point, it turns out one of the partners of Triple Point comes from a divestiture background. Okay, this guy here, this Aaron Latham, and the experience he was having was, say he Worked in oil and gas for a long time. BSU P Bulletin as a landman. So basically managing those assets and those portfolios for large amounts of oil wells and oil fields. And his whole point was like, there'll be times where I have a, you know, a portfolio of say like 500 sites. And 200 of those are pretty likely to be good sites. 300 Of them, we don't know. They could be duds, they could not be. But you take that risk. You have to buy all 500 if you're gonna get these 200 good ones.

Michael Byers-Norton - 25:18

And that's where he came from of putting together those offerings and succeeding at transacting on them in the oil and gas space. And so he's like, dude, that's what you're talking about here. Like, yeah, you can go through and cherry pick, you can go through and complete all your diligence on them, but that sounds like a lot of work. Why don't we just go buy them all for 200 million and turn around and sell them for 400 million? That's it. Like that. His whole idea was just to find an off taker who wants to buy the portfolio instead and don't do due diligence beyond what we've already done.

Michael Byers-Norton - 25:48

If we fill up a data room with little drawings that we have right now, the test fits, that we can put together pretty

quickly for each site to show if there's space in the parking lot to densify or not, or that square footage versus current UPS work to show there's densification potential inside of it. Like they think they can find an off taker for that deal. So when you buy the portfolio. Now, I haven't pitched this to Darren yet at all. This is to just the networks going through triple point. So assume that is true, then it changes our dynamic with how we engage with the carrier. Because now it's like, hey, we're representing a very branded respectable fund that is looking to take over this portfolio to develop it into an edge platform. Let us start talking.

Michael Byers-Norton - 26:31

And that puts terabyte at the front and center to do our job to help them structure that program. Triple net leases versus densification sites where it's genuine lease. You know, figure out what we need to do commercially that way. Because Aaron brought up a good point. Just doing the title studies and all those properties is going to be an insane amount of brain damage. Like there's a lot of real dumb work that's going to pop up here that needs to be funded. Like, well, yeah. And so the dream kind of came together then, like, all right, if I'm doing what I usually try to do, which is appease everybody in their dog, New Edge coast snipes the 12 best sites that we like the most, whatever number that is.

Michael Byers-Norton - 27:10

What we put together a SPV investment case to build a small portfolio of sites to pre lease the excess capacity to a modular deployment. Drop in that XCT node, drop in a giga node, a skyball, Any of these groups that want powered capacity in a space and parking lot, we pull those sites off and try to do those ourselves. Proper developments as the controlling party of it raise funds to go do those the right way. Then the remaining portfolio of bulk sites, try to flip and just do it through the Triple Point effort. Moving in bulk. Don't bring in everybody else in their dog. Don't get it too complicated because it's gonna be a smaller margin play and it's already a lot of fingers in that buy. But just try to transact it as one big push.

Michael Byers-Norton - 27:59

I'll pause there because that's a lot of a pitch. Yeah.

Tucker Adams - 28:03

So just to clarify when you say that. Well, let me run back that I even heard the right thing. Triple Point has some buyer that would be interested in acquiring the entire portfolio. Or Triple Point is the buyer.

Michael Byers-Norton - 28:19

No, they would just be the middlemen. They throw 6 or 12 million at it if they had to. They'd get the debt to go, take the full 200 out. They knew they didn't offtake it from 500, but they have no desire to develop the sites. They just want to move them the other way.

Tucker Adams - 28:32

They just want to move them.

Michael Byers-Norton - 28:33

Okay.

Tucker Adams - 28:35

And so where does New Edge co sit in that? Is it helping them do the, like, do the diligence of things like permitting?

Michael Byers-Norton - 28:44

Yeah.

Tucker Adams - 28:44

So there's nothing for us at all there.

Michael Byers-Norton - 28:47

Not a good lane for us. So. And I needed to sync with you to put that together to see like, how would we even think about this pitch? Think about this approach. Because it's like when I threw together a shitty Claude version of it. Let me share my screen here. Brushes for this too. Welcome back. Yeah. Moment. It just wraps you. Because they started asking those questions, like, great, how much money do you need to put this together? I was like straight to where Triple Point went. Like, what do you need to really pull this off? I was caught flat footed. I'm like, you know, it's that moment. So I just made up a number.

Michael Byers-Norton - 29:24

Like I need to be able to do an ESC and a RAR for Every site, I need to be able to stick Darren on it for ten grand or something for every site. When you have a budget to go walk and poke every site, like what? I just need some sort of minimum number to wrap my head around. And then for the sites that move forward, I need to be able to architect and design, you know, test fit. In other words, the ones we're gonna drop in the parking lot. But if we're actually gonna do a retrofit and densify the sites, I'm gonna need real budget there. And that's like a bit more expensive per site to try to actually, like, put together. Hey, we need to densify you down to three racks over here in the corner. Are you comfortable with that?

Michael Byers-Norton - 29:59

That takes more time. And this is just me just putting ideas on the paper here. Right.

Tucker Adams - 30:03

I thought they were not interested in doing development work. Are we counting this as like pre development work?

Michael Byers-Norton - 30:10

Yeah, they're just calling. This is brokering a deal. That's the worst part. Like, and so I took the extra step of like, if I'm in the shoes of a buyer here and I need to hear a sales pitch of why I should believe in this portfolio. That's where this little bit of work potentially gives us a pitch. Because it's not full development work. The only thing that you're talking development wise is potentially talking to the utility. That's if we had to go this route. Because if we don't have to do any of this, and this is kind of where the Aaron guy talks pretty quick, we might not have to do any of this. And we might just be able to say, hey, here's your portfolio.

Michael Byers-Norton - 30:44

But I know if I put a deck together to show a cluster around Ohio and Atlanta, like where those sites are within that distance from each other, it's going to trigger the guys who are trying to build a new market to be like, oh, this site's amazing. I can get a dozen sites that are within 25 miles of each other in this market. Yeah, we'll buy those, you know, type of moment. So, I mean, you can see that we might not.

Tucker Adams - 31:06

Oh, sorry. When we say that we might not even have to do these things, it like, this is a lot of work to TBDI, right? Or new edge code or, you know, whatever we want to market under. This is, you know, it's not us being equity partners, but I don't think it'd be the worst thing in the world if they want to use us and use our help to get this Development work done. Right. Like that's a lot of cash flow to Terabyte if they use us for that pre development work. Right. Am I thinking about that in the wrong way?

Michael Byers-Norton - 31:39

100 No, that's what's, that's what I'm trying to figure out too. Right. Because we haven't figured out structure of sharing a joint venture component of this yet. Like there's been no bigger discussion on where we fit or not. And I'm muddying the waters there because they're trying to make me a managing partner of the company. Right. So it's already like from sitting on the triple point side. I don't see there being something there. But that's where new Edge co or figuring out how we want to do this is the middle ground. And that gets us back to who actually controls the sites. Because if we need their money and name to go control the sites from the carrier, we're now at a. We have less leverage at the moment and that's likely where we're going to be for this portfolio.

Michael Byers-Norton - 32:22

And the fact that just for the first sites that you and I down selected these 40 sites, that alone is \$101.7 million bill.

Tucker Adams - 32:34

That gives you the flexibility to do a lot of other things so long as you can make that an efficient yield use of specifically your time but also the time of whomever else is contributing to it. I don't think that would be the worst thing.

Michael Byers-Norton - 32:47

It's your time. Think about it. Like look at what you just produced for me, right? Like the ability to go through each site by that and draw what's on the, what's outside the building size and figure out if I can drop two units on there. That's grind. But that's worth, you know, 18 grand a grind. Yeah, yeah, it is. Like it's one of those like, dude, yeah, we can do this. We got this. Especially if we take a smarter approach on it and automate it. But it just highlights insane potential there that if we're going to go after all 200 sites which we think it exists. I told them I need somewhere between 6 to 8 million. I was being conservative, probably close to 12. And they didn't bat a eye. So that's the crazy part.

Michael Byers-Norton - 33:32

Yeah, like, so these guys, like I saw people pitching them sites that were not as far along developed as the sites I usually go after. They're like, so you just need 6 million to keep control of the site and pay this deposit here. All right, Mike, what do you think? Like they weren't worried about the number at all. At all. Yeah. And so it's just a different tool than I've been around because I don't have a lot of experience in venture investments. But this guy, this David Beasley, like he apparently was the number one AI seller for alumni ventures for the past two years. Like he's been incredibly respected and they're getting awards for being one of the top venture capital groups in this space right now. Supposedly. Supposedly. Don't know how much to back that up. I'm dug into it. Right.

Michael Byers-Norton - 34:15

But they're giving him the thumbs up to go start a fund. Like a thumbs up manner. So it's just one of those like he's. He don't around. He's already in. He's in meeting with Nvidia and AMD and Microsoft and Meta to be financial backers for his fund because they all need a bunch of sites. And so it's a weird middle ground right now of like wait a minute, how big are our balls? Right. Like what are we trying to do? Because if we wanted to go ask for 5 million to stand up new EdgeCo to go chase five sites. All right, let's talk. Like it's that weird moment in time where we cross that path. So it's.

Tucker Adams - 34:59

But that's kind of the moment. Yeah. There's also. I'm trying to think through how to say it while remaining sufficiently optimistic. Like yes, the, you know, the huge opportunity could be there. And I think 1.72 terabyte is like a great outcome if that is also on the table.

Michael Byers-Norton - 35:31

Appears to be where we are.

Tucker Adams - 35:33

Yeah.

Michael Byers-Norton - 35:35

So it comes back down to like we need to get control of the site. So I'm pushing on reverse side to get control of the site.

Tucker Adams - 35:41

Okay.

Michael Byers-Norton - 35:41

We need to have a program in place to get this done. So I need to start getting quotes essentially from Darren. You know, how many sites can you handle at once or not? And even then there's no guarantee that they actually want to do all this review on each of these sites.

Tucker Adams - 35:54

Yeah.

Michael Byers-Norton - 35:55

So that's Aaron's whole point. No, we just talk to getting control of the sites from the carrier. You need to do your magic to deal with the sale leaseback part of it. Great. What's it going to cost? But he doesn't necessarily want to go talk to every utility of every one of these buildings. He thinks he can move the whole portfolio without doing that. Yeah. So it's.

Tucker Adams - 36:13

Which then is really no lane for us to do anything right now.

Michael Byers-Norton - 36:18

We have to put together a solution still per site. So to identify the sites but know that they're real. Right. Because that portfolio was 2,000 sites and 90 of those were telephone booths.

Tucker Adams - 36:27

Gotcha.

Michael Byers-Norton - 36:28

They weren't. So there's still our work on it.

Tucker Adams - 36:31

So there's some hours in there.

Michael Byers-Norton - 36:33

Yeah. Yeah. There's plenty of. I think there's hours. There's enough to kill you. And I easily. Is my whole point. Okay. But it's. But it's just super interesting. And it's. It's like, where do we really try to steer and take. This is kind of where my head's at. Because it's. Is it worth the time? So I'm gonna derail us pretty hard here. If you're ready to. The other account that we had success with while you were out was Path one, the group that wanted to buy a terabyte a month ago. Right?

Tucker Adams - 37:03

Yep.

Michael Byers-Norton - 37:04

Sat down with their CEO Thursday night for like four or five hours. He flew out just to sit down for that meeting and catch up. He's a friend too, so it's just a good way to do it. Okay. It was great. Him putting insight together. Like. Yeah, he wouldn't be doing this if he didn't have those guys supporting him because they know how to engage on the land front, get control of the power and know how to get really good deals done. Not data center people, but you can trust them to do what they do. And they're very grinders and aggressive in doing it. And so we talked a lot about that. Just leadership concepts. Because I'm. I'm like, hey, it's. You know, I tend to lift people up in my company more than being lifted up by them.

Michael Byers-Norton - 37:44

And I use you as a good example of that where like now this dude is, you know, definitely able to do shit that I cannot do. It's. It's amazing. Versus taking people. I'm trying to like, build a role for them in real time. And so. But he's like, yeah, that's exactly it. But going through the process of how to actually get deals done. He knows he needs me. Needs that role to see that picture. To be able to put the business case together to what the client needs to be able to get a solution actually works and know where to put your focus and attention on running a portfolio. Where it got fun is three things popped up while I'm sitting down with them. Okay. One went through their portfolio of how many sites they're sitting on right now.

Michael Byers-Norton - 38:26

And it was still enough to be kind of Crazy. I think they had a dozen sites that already had 25 megawatts confirmed by the local utility. Because of how good. Yeah, each, each.

Tucker Adams - 38:45

Okay.

Michael Byers-Norton - 38:46

Yeah. This is why me not burning terabytes the ground take 20 of that company is an interesting debate, isn't it? But still, nonetheless, they have those because how good their grassroots ground movement is. They talk to the local economic development groups who are like, hey, we'd love to get that tax revenue in. We're very tight with our local utility because it's a small area. Local utility says they have 25 megs at the substation over here. Here's Bob, who wants to sell his farm. Like the community's putting together the portfolio pitches to them to run. So that's like floating around right now as something very interesting. At the same time, they have one large ass site that they've been chasing for a hot minute that kind of put together the band in the first place. And that site is next door to Meta.

Michael Byers-Norton - 39:33

So they know they can fit 600 megawatts of power on it and they're trying to work it. A previous partner of theirs took away three other sites in that region. And somehow Caruso is moving into those three sites right now. So like they got kind of by one of the local guys who saw more dollar signs, were working with somebody else. The fact that caruso is moving 50 megawatts into rural Nowhere, Missouri, it just shows that the smaller edge thesis is getting real. Like, it's. It's hot, it's getting real. So were drawing this on a wall to figure out what to focus time on. Like, and so made a vertical of like 1 to 5 megawatt sites, a vertical 5 to 15 megawatt sites, a vertical 15 to 50 and

a vertical 50 to 150 and vertical 150 to 300 plus.

Michael Byers-Norton - 40:26

Just because they're different niches of capacity that people usually take down. Trying to help them think about, are you trying to own and operate sites or are you trying to do build to seats? Because there's a fundamental difference there on how you make decisions around design and construction and staffing, which is what I knew was his problem. Like, that's been dropped in his lap completely because the rest of his team just doesn't get that right.

Tucker Adams - 40:48

So where should it take the build or staffing the final data center?

Michael Byers-Norton - 40:52

The build. He's like, he doesn't worry about the upside. Yeah, we'll just hire Salute. He's being one of those guys who just assumes he can turn key it. I'm like, all right, great. I can work with that as a product guy. We'll deal with that later. At the moment, in my view, but it's true, like there are operators out there that will do everything for you. Turnkey. From operations perspective, each one of these sites is a, you know, six hundred to a thousand people, construction wise. And so his world is that construction, deployment, staffing, like who we bring in for design, for architectural, mmp, for coordination, like commissioning, like that's his world. He thinks in that way very clearly. And so that's kind of where he knows a build to suit, building on somebody else's behalf versus your own design.

Michael Byers-Norton - 41:31

Like he knows the real differences culturally and challenge wise between those. For example, so he has this big list of sites that are there. He has these six ones right now that they currently own and plus another 10 or something that are all in the same megawatt range, quote, unquote confirmed. Like that's why they're putting the raise together. Go after those. So for terabyte, that's an opportunity for us to help them land anchor tenants into those sites and get commissions on those deals as sales engineers and business development support. Because that's where they need the most help right now.

Tucker Adams - 42:05

Okay.

Michael Byers-Norton - 42:05

And that our 2% there gets burdened on to the deal. They never have to see it out of their pocket. So it's a very nice sliver for us to live in. If I'm going to be putting hours into them, I need a coaching retainer. And if we're going to be doing per sites, we'll need retainers per site or reports per site. So I need to sync with him today to finish that out. But we have not been able to connect properly today because, yeah, he's trying to go on a two week vacation with his brothers to Italy. So he's, he has a week of work here to get done before he off and then comes back in a big way again in September. All right.

Michael Byers-Norton - 42:40

So nonetheless, where shit gets fun was this portfolio here of sites that they can potentially go after and own right now. And these are sites that are already powered today.

Tucker Adams - 42:54

This is available.

Michael Byers-Norton - 42:57

Power immediately.

Tucker Adams - 42:59

That's not spoken for by equipment that needs to stay on.

Michael Byers-Norton - 43:04

I don't think so. Okay. I didn't pry into it beyond taking notes in this list and help me put in a bucket because only like four of these sites are above 4 megawatts. A bunch of them are very small. Yeah, but it highlights like if somebody just brings him a list of these sites in A very focused snap of the country goes right back to what were talking about. New edge co wise. So this part of the game isn't going away. This is an emerging market that's only gonna get louder. But for when I'm advising path one and how to navigate it, I'm like dude, you have sites at 25 megs right now with power. That's a quarter billion dollars of investment. That. Yeah, go, go. That's the same size a family office can handle. Right. They're 200 to 500 million of investment.

Michael Byers-Norton - 43:57

They're not jillionaires. Yeah, like run on that. These here are an incredible distraction. But if you can control them and just drop in a modular or flip them to triple point partners who has a group hungry for those sites, this is still an emerging market. This is still real. Like this is not going away in America due how our large scale utilities are in this country.

Tucker Adams - 44:20

Yep.

Michael Byers-Norton - 44:21

So it's like I'm just blowing hot air up your skirt right now dude. Because this is real. Right. It's just one of those what do we want to do about it type of moment, you know. And that's. There was no easy answer there. It's just highlights. For a small team like them who's just putting their initial raise together, they're not gonna have time for these properly yet. They're all these sites, if you are going to go after them to build or sell a couple meg data center into them, you're still going to need the full terabyte suite. Right. Like you're gonna need to put together a business case, a diligence case, a total overview package for every one of those sites.

Michael Byers-Norton - 45:00

And if you knew how to drop in power to it, if you had relationships with a couple different modular providers who can do it, well that's not a bad solution path to be on. Right? Yeah.

Tucker Adams - 45:11

So to me this looks like a new source of potential sites that we could run the kind of originally envisioned playbook on that includes some amount of development. Right. And it you kind of remove the triple net leaseback aspect to it because there's not equipment that we're trying to keep on, keep going. Right. And so the question to me then becomes like could we get the money to go after these and sell them someone? Right. Which then leads me to do the triple point guys. Are they not interested in any kind of development or is it just that they saw the list of 200 sites and they're like we're not interested in development for those.

Michael Byers-Norton - 46:06

They're interested literally in whatever they can get from me. Like they want to do development. Great. What's going to cost? Put the development program together. They'll get it done.

Tucker Adams - 46:17

So wait, where.

Michael Byers-Norton - 46:18

Okay.

Tucker Adams - 46:18

I'm getting confused. What did they say they were not interested in development for.

Michael Byers-Norton - 46:26

For the 200 site portfolio. Okay.

Tucker Adams - 46:29

But otherwise we had a new edge.

Michael Byers-Norton - 46:32

Co that was putting together.

Tucker Adams - 46:33

Yeah.

Michael Byers-Norton - 46:34

And the new edge code had the ability to own and operate those sites or flip them to one of the buyers. That triple point as we just wants to buy those type of sites.

Tucker Adams - 46:42

Yeah.

Michael Byers-Norton - 46:43

Yeah. Let's go in the \$6 million they just were offered to throw out at this pre powered land site and near Cleveland. And they still probably go after it. I can't stop them. Like that's to finish the development. Like they're looking for distressed assets that they can drop stress developments. They can just drop in and be a hero. Give them the funding to get through the bridge. It was like their initial thesis they put together for that program. Okay. And they're chasing way too many ideas right now. They're way over their skis.

Tucker Adams - 47:09

Yeah.

Michael Byers-Norton - 47:09

But it's because they're at the. They're just still at ideation putting together the org. Right. Like it's still. Yeah.

Tucker Adams - 47:15

That was what I took away from the whole call that I was on with them is like lots of excitement, not a ton of understanding yet.

Michael Byers-Norton - 47:23

Yep. Yeah. And they're going to though. These guys are aggressive and bright. Right. So it's a. So I don't know. That's kind of where they sit today. But it more highlights. Like we need to create something here to be safe. Right. We need to create a. What can we realistically handle here before we get in trouble? Like what do we want I guess is a better term. Right. And that to me is a super interesting time to be thinking about the Soul Machine because it's. It's here right now. It really is in front of our face at the moment here that even just chasing this small portfolio of sites here could be worth a half a billion dollars. A value creation. Yes. We went and controlled and developed those. Landed in a modular group and pre lease the capacity 165.

Michael Byers-Norton - 48:18

You know annualize that revenue. 50 EBITDA on that annual revenue. 10 Year exit. Like that's crazy numbers. Right. It's 450 million contract value potential exit on top of that. It's just.

Tucker Adams - 48:33

And you think that the. That the triple point guys could be interested in being the money behind that kind of play.

Michael Byers-Norton - 48:42

Yeah. 100. What if we have a pre dev capex. Like what do you and I need for redevelopment wise for this?

Tucker Adams - 48:52

Yeah.

Michael Byers-Norton - 48:52

And say it was 120,000 per site. Yeah. They have no problem giving us that money. Right. Like, that's the crazy part that we're in right now. And so it's. They would obviously negotiate it. They put together that business case to make sure it was worth their time. But if we're like, hey guys, we think we can turn \$1.68 million into about \$90 million a year in revenue. And then this is going to be some. So this is going to be. Make this 120. So this is TBI dev. Then we have. Then we have dev and then we have build dollar per megawatt build total. And then pre dev,

Discussion - 2026.09.08

just galaxy. And so if we needed to finish development out and we said, hey, we need like six. Like that's the trouble. These are so fucking small. Like how much dev cost we really need?

Michael Byers-Norton - 49:54

We're dropping a modular. How much? Like they already have power. Dude, do we even need 120 grand for what the fuck we do? I mean, probably not. Right? Like that's the craziest reality check here. Like, do we really need a ton on this? But that's why we model shit out. Right. We can always figure that out as we get through this. But the build cost for these is \$12 million per megawatt. And this is going to be equal to that times that. Yeah. We don't even add the 120k to. It's a joke. Right? Like, it's just a. It's one of those items here. If they wanted to build, own and operate these sites now they put in that 546 mil to work. And the crazy thing is they don't need to. The Skyball group wants to own this part of it. Right.

Michael Byers-Norton - 50:57

Like, that's their machine is the build side. This is a client build total.

Tucker Adams - 51:03

Yeah.

Michael Byers-Norton - 51:04

Us and triple point would just be this.

Tucker Adams - 51:07

Yep.

Michael Byers-Norton - 51:10

So that's kind of where I'm just trying to.

Tucker Adams - 51:12

We're selling. Yeah. Okay. What, what are our timelines? And, and this can be a conversation, but like what do we need to put together to advance this, to move this forward?

Michael Byers-Norton - 51:32

So I need to learn how to spell total. Bam. All right. It's heading out there to see them on the 24th for dinner. That's going to be like the final Kumbaya. If we can pass the airport test and drinking test, we'll be fine, right?

Tucker Adams - 51:48

Yep.

Michael Byers-Norton - 51:49

But everything seems to be going the right direction. I don't think this fund is like.

Tucker Adams - 51:52

Testing a long time.

Michael Byers-Norton - 51:54

Yeah, that's. Yeah, it's been a couple years for me too, actually. But still it's the. I think the fund is going to take time for larger raises. Sure. But their ability to throw around 2 to 6 million right now is. Doesn't seem to be anything to them. Yeah, they already secured 2 million from a family office like last week. I think they've probably done the same since we're talking here now. Like, this is the world. These guys live in, the period. And that's the crazy part. And so any of these projects, if you and I aren't credentialized as two individuals on this. Enough. Great, let's go find a partner we can pull in who has a bigger name next to theirs.

Tucker Adams - 52:34

Fine.

Michael Byers-Norton - 52:34

Yeah, they'll get it. And so it's. It gets back to like, I don't know what to do here, dude. Like, this is. I haven't had the keys to a kingdom in a while and I'm not experienced enough to know how to go after it more than oops, I'm gonna bail out and just charge you a certain pre dev amount. Like it's. I'm kind of. Okay. Haven't fully comprehended yet how to fully get maximum opportunity here because they're willing to listen.

Tucker Adams - 52:59

That can be a. I can also go run that down type of question. Can you send me the. Or just point me to where, like give me links for the stuff that we're looking at right now just to not reinvent the wheel.

Michael Byers-Norton - 53:12

Yeah, let's do that before we jump off here. So I'm going to Tucker and wait.

Tucker Adams - 53:18

Sorry, I'm getting the various pieces jumbled. Are you seeing any potential way forward on this 25 megawatt sites or you're just saying, like they should be concentrating on those and therefore they should want to sell us these.

Michael Byers-Norton - 53:35

Yeah. So for them, for me as a consultant for them, I'm saying, guys, that makes the most sense for where you're sitting right now. Yeah. Like they're still obviously going to be involved in these ones because they control them today, but they don't know what to do with them yet. And that's where I need to catch back up with Jim and be like, hey now, you slept on it. What are you thinking here? Because this might be something where new Edgeco just takes these over as a joint venture with Path one. Right. Like there's options here. And that. That's kind of Where I think I'm overwhelmed but incredibly stoked because we have so many interesting ways that these call can be synergizing with each other.

Tucker Adams - 54:10

Yeah.

Michael Byers-Norton - 54:10

And I'm just trying. We have to put, we have to put together a plan. Right. We have to have what terabyte does is to our clients. We're going to be doing to each of these sites ourselves and each of these portfolios ourselves. Do we believe in this? Do we not? You know, how do we verify? Trust and verify. And that's where like all true digital popped up in this discussion. But they're in the danger zone now because they're so busy they might lose their main data center Expert guy. But he spent the last six months reviewing the six top modular data center companies to see how real they are, what their supply chains are. Like he has a lot of knowledge in his head alone that can launch things up very heavily. And he doesn't have enough like Ultra hasn't raised enough funds.

Michael Byers-Norton - 54:48

You get to hire him full time. And so it's another one of those weird ones are like oh if we go raise a certain amount to chase this portfolio and maybe chase 10 sites from the carrier portfolio. Why don't we just either hire that guy or joint venture like it just starts to snowball into what are we trying to do in an incredibly inspirational way. Like not in a stress way at all. Just in a. Oh this is here. This is kind of where I started wanting to back off a little bit on let's make terabyte a thousand percent scalable. We're at training programs to be able to grind people on this. And like nah dude, just if we believe in what the we do, let's go make some goddamn money, you know type of moment.

Michael Byers-Norton - 55:27

Because we have the knowledge now if we can standardize and lean on that investment, grade it.

Tucker Adams - 55:33

For what it's worth. I don't think that anything that I am doing right now will have zero value to any kind of multi site program. Right. Like the things that I am doing right now even if they are purpose built for generating reports. Like I'm finding where the information lives. I'm finding the way to use Claude code to analyze it. So this will be partly at least transferable to the type of program that.

Michael Byers-Norton - 56:04

We're talking about now. Good. You're standardizing and scaling the ability for us to process sites.

Tucker Adams - 56:12

That's what I'm saying.

Michael Byers-Norton - 56:13

That's it. Just keep it at that level like and just refine everything we're doing to that level. Because you're Seeing we're going to see even with just one account right now, 600 sites. 600 Meg sites. 24 Meg sites was the smallest one 920 kilowatt sites. Right. We're going to see it all. And if we just know how to make good decisions and put together a dream that we can defend and have the right ability to go to investors to raise the funds and have the right resources that we can hire to scale. Yeah. Let's go, man. Let's go. So you and I still need to sync back up to dive more into this real quick. But last thing I want to share with you which is way too much for the end of this call which I'm a fool for even trying.

Michael Byers-Norton - 56:55

I'm going to you put this call.

Tucker Adams - 56:57

On the calendar for half an hour which immediately I laughed at, but go ahead.

Michael Byers-Norton - 57:00

Yeah, I should have booked an hour. I intentionally. I didn't book my next call for a few minutes. But I made the mistake of adding people to an our team call. You and I need to sync on comp and goals shorter and longer term. And I need to learn how to be a better leader because every time I talk to this like half the people get egos that are huge and half of them are like I love it. I'm all in. And you might have been really good about this in the past, but basically I tried to rebuild this year and I tried to make a view on it. So I'm not violating other people's. But it's the concept here of like how many hours can I abuse you for a month?

Tucker Adams - 57:29

Yeah.

Michael Byers-Norton - 57:30

Based on the ability for us to sell reports. And I have a analyst I pay and I pay for those reports and I have a certain commission I pay to biz dev what is my project net. And then when I try that I'm.

Tucker Adams - 57:44

Trying to get those numbers up by virtue of automation. But yes.

Michael Byers-Norton - 57:49

Yeah, but I'm just more showing you. Yeah. Yeah, dude, let's do it. I want to get you paid is the whole essence of all these. Yeah. You know we're not slaying it right now. You know, we got about 35k coming a month. And so in a couple of smaller reports here, we think these guys will turn into a retainer in the funnel. We have one a client for 27.5 who gave us a verbal. He'll sign that on the first for at least 20amonth. Yeah, cool projects too. The one nerd on that when you got time. The paper mill project right now is looking like the and that's the report one we're doing up here. But that's going to be hopefully another six month retainer. We're trying to get development commission on that one.

Michael Byers-Norton - 58:27

Path one is going to be at least 20 grand a month, triple point. I'm telling them I need, you know, 15 to 20 grand a month to be able to hire people like yourself to be support on their huge number of sites. Like we have real costs. That's not a mike incentive. That's a. Let's abuse the whole resource pool. I have stacked up. And then server domes came back. They got their funding last Tuesday. 200 Million cash. Another 500 shows up in like before the end of the year. But they don't want to put us on retainer right now because they. Their current new CEO is a solution architect himself. But they know they need reports for site diligence and site selection.

Tucker Adams - 59:01

All right.

Michael Byers-Norton - 59:01

So we should assume between seven and nine reports from them. I need to put together the quote this afternoon. And then this Reckoner machine is the one that Bobby's been nurturing really heavily. They're another. They're trying to do a path one is doing just from a powered perspective instead of they're about to get funding and that's probably another 20 grand a month retainer.

 Tucker Adams - 59:19

Yeah.

 Michael Byers-Norton - 59:19

So with these coming in all of a sudden we can pretend like we're a big boy company a little bit. I think this gets us to almost 2 mil annualized. And that is a reality check. Then of great. If I'm just paying you 150 an hour at 80 hours a month, you know, does this get you hot and bothered? Right. Because you start seeing the workload that is coming at you. And if this success starts to snowball. Yeah, we got to figure out what the fuck we're doing and that none of this touches on incentives at all. Right. This is purely just. I'm just putting it together as a tool. I'm not trying to pitch you on anything here besides get hyped.

 Michael Byers-Norton - 59:58

So let's grab time to figure that piece out because then I'm also trying to figure out how to get you paid because I went through on half of these and said great, if you're 15 hours a month per retainer and that's kind of representing your ability to navigate the optimization. Half of this, like, I don't know, I'm trying to figure that piece out if. Because this whole tool is just based off cash. And so that's kind of. It just shows you I'm just being transparent where we are because I've been trying to do this. On what support research do I need per project to be successful here? And then how much can I possessly pay sales to make this successful here? And like, that's just kind of what I'm trying to. That was the attempt.

 Michael Byers-Norton - 01:00:40

So we should probably find time later this week to dive into this a bit more. But just know that I'm ready to talk about it anytime you are.

 Tucker Adams - 01:00:46

So do you want to do like a Thursday morning and that'll give me tomorrow to keep pushing on stuff and then we'll have additional, you know, to talk about at that point?

Michael Byers-Norton - 01:00:57

Yeah, let's do it. Okay, perfect. Yeah, that's the other piece floating around, dude. Because it feels like everything's starting to gel in a scary way. So.

Tucker Adams - 01:01:14

As a. As a last note before you sign off, did you slash. Do you watch South Park?

Michael Byers-Norton - 01:01:21

You mean South America?

Tucker Adams - 01:01:24

South park, the show.

Michael Byers-Norton - 01:01:26

You didn't see that? They released a Twitter thing announcing their next season starting on 16th, where they changed the name of the show to South America to show camaraderie with America. Yeah. So, yeah, I love south park, but it's fresh off the presses. But yeah, all of.

Tucker Adams - 01:01:41

All of this. I. And I'm like many seasons behind at this point and probably should go see some of the recent one stuff. But if you saw one of the early episodes where Butters becomes a pimp, like selling all of the his classmates for kisses at lunchtime, he just keeps saying, come on, don't you want to start making some real money? And that's what this feels like. Anyway, with that, it's dead on, dude.

Michael Byers-Norton - 01:02:06

I think me being a brother, money, dude, that's so proper. That is so incredibly proper too, so.

Tucker Adams - 01:02:13

Oh, good.

Michael Byers-Norton - 01:02:13

I love it.

Tucker Adams - 01:02:14

All right.

Michael Byers-Norton - 01:02:14

Absolutely love it.

Tucker Adams - 01:02:15

There's. I'll get no better sign off than that, so we should end it there.

Michael Byers-Norton - 01:02:19

Mike, drop that. All right, man. I'll bet you soon, dude. Really appreciate you. Appreciate it.
