

Tucker Adams - 10:39

How we doing?

Michael Byers-Norton - 10:43

Not too shabby. So how about yourself?

Tucker Adams - 10:46

Good.

Michael Byers-Norton - 10:48

Thought.

Tucker Adams - 10:48

A lot of thoughts today for 10am in a good way.

Michael Byers-Norton - 10:53

It's all good. All good. And sorry I'm throwing off a little bit. Client caught me for a fire drill last hour, so just trying to. Yeah, trying to process everything I just ran through as well and then normal, man, but glad you're firing all cylinders this morning.

Tucker Adams - 11:13

Fair enough. Do it like we got a lot to talk about if we want to. We've got kind of two totally separate, well related but separate topics of NEC and the automation that we've been working on. I shot some notes and I'll probably just work off that as my own outline, but I could. What about I show you like some of the automation stuff that we've

arrived at, talk about. Any questions on that? And then after that we go over to the new Edge. Edge CO stuff or is there other stuff that you have on. On your radar that we should put in there?

Michael Byers-Norton - 12:01

No, I think that's enough for the moment. I'm gonna follow your lead on that. I'm just getting this last thing off my radar right now, so that way I can give you my full attention. Somebody's trying to pull me to it, man. It's horrible. All right, so let's talk proper. I am 100 yours now. We're here.

Tucker Adams - 12:22

Share my screen. I'm going to minimize the page full of Reddit Saints threads and then we can proceed looking for what of R Saints threads. So now we're in the clear.

Michael Byers-Norton - 12:46

Dude, I got suckered into joining a fantasy football team this year. Like my buddy who's like religiously into it, forced me to draft a team with him last week. So it's like.

Tucker Adams - 12:57

I've been doing the same league with buddies from grad school for I guess like this is year number six,.

Michael Byers-Norton - 13:06

Is that right?

Tucker Adams - 13:08

Would have been 20, 21, three. No, this would have been year number seven. What? It's a 10 team league. I split a team with a buddy of mine. Like, you know, just co manage everything and we've won twice. So I. We were pretty pedestrian last year. I think we're due for improvement. But the draft was supposed to be Monday night. And then like something that happened with the system, like the draft order wasn't right and then Yahoo wouldn't let him change it. And so we're like, screw it, like we'll do it on Tuesday. There was one guy who still had two other drafts on Tuesday, so he's bitching about it. But like whatever. We do it on Tuesday and then only after the draft has

happened.

Tucker Adams - 13:57

Two of the guys that are in the league are like, well, I also got a notification to draft for our 2024, 2025 league. So that's the one that I drafted in. So my entire team this year is auto drafted. It's like pay any attention to anything. Like, what are you doing, dude?

Michael Byers-Norton - 14:20

Yeah, no, it's. That's proper. That's a weird. That's a weird cluster.

Tucker Adams - 14:25

Yeah. So we're off to a great start so far anyway. Okay, I'm gonna try to remain on task for the next half an hour here.

Michael Byers-Norton - 14:34

We've done ourselves. Where are we at?

Tucker Adams - 14:37

Okay, what we're looking at right now is the working version of the ledger associated with basically just pointing at the Williamsburg site and starting from scratch. That was the way that I've gone about it. Every row in here is a piece of information. It's a fact or figure that's going to go into the report. It gets its own row. It gets its own like what section is. Is it associated with? This is like the. I'm gonna minimize these. The actual item origin is like. Was it generated by quad to some degree? Was it from identify that. That's like inference. And then the status column is. Everything right now is unverified. And the verification is you verifying things or a expert verifying things. It is. Has somebody looked at this and said yes, that's right. So that's the human in the loop.

Tucker Adams - 15:48

Don't put anything in there that we haven't said, yes, that's correct. Step. The attribution is where did we get this thing? You know, retrieve.

Michael Byers-Norton - 16:02

How close is that to being something we can validate properly?

Tucker Adams - 16:07

Right. How do you mean?

Michael Byers-Norton - 16:09

I don't know. So if I'm a analyst coming in to go through the statuses and verify them.

Tucker Adams - 16:16

Yeah.

Michael Byers-Norton - 16:17

I click on the item right here, like you just did. Pulls up the. Pulls up this attribution, right?

Tucker Adams - 16:22

Yep.

Michael Byers-Norton - 16:23

And then are they going to just like Google search it then.

Tucker Adams - 16:29

It also is saving the files that it is using for these in this file structure. And so you just be able to open that run.

Michael Byers-Norton - 16:39

So let's get to that. I think I'm jumping a step ahead then. So perfect.

Tucker Adams - 16:44

You're thinking about it the right way with the additional piece that. The way that like I'm calling it the archive. It is saving these files down. It is saving like the metadata associated with the search. And so if two years from now somebody's like Wait, where did that come from? We can say we ran this thing on this day. It gave us exactly this data. Here it is. And so that these codes are like references to the files that underlie it. And then you'd be able to.

Michael Byers-Norton - 17:25

Yeah, that's the shit, dude. That's awesome.

Tucker Adams - 17:27

Yeah. And so the, the last piece there is some of the information that's going into the report is like files that URI already had. And so those don't have the structure built out to like index them yet, but that's on the list. Everything will have. This is the file, this is how we got it, this is when we got it, etc.

Michael Byers-Norton - 17:55

Perfect.

Tucker Adams - 17:57

That's the ledger piece. I think there's an additional element to this of like, what does the final process look like? We could you or analyst look through every piece of this. I think there's probably some streamlining that could

happen because like for example, some of these rows are, you know, we found where New York is and then we measured this line between the site and where New York is. Right. So I think a verification step could be like we verified that you're looking at the right parcel and then everything that is a known location in a measured distance gets auto verified. You see what I'm saying? Like we don't need to line by line, say, oh yes, the number to Chicago is correct, the number to New York is correct, etc.

Michael Byers-Norton - 18:56

Yeah, I think it's as we earn trust, as the tool earns trust, that helps a lot. Right? Yeah, because it's those stupid errors I'm mostly afraid of. Like it's 2,000 miles in New York because I that up before doing latency Galaxy, I'm like, oh great, I'm in kilometers. Like just those human errors experiences. But I think this makes a ton of sense. So I like that.

Tucker Adams - 19:13

Speaking of one thing that I was getting confused about, are San Antonio and Houston supposed to be on a bunch of these maps?

Michael Byers-Norton - 19:23

Nope, those are incorrect. Yeah, we should probably delete that.

Tucker Adams - 19:26

So it took me a second until.

Michael Byers-Norton - 19:30

Anyway, no. So the whole reason that happened was trying to use the template for the background and then force this data into it. But I don't even remember how those things popped into it. So it's just a huge error. So doesn't matter.

Tucker Adams - 19:42

Okay, so that's so weird. Before, before we go into the deck, several caveats and then maybe some bragging after

that. I've done like the first half ish of the deck, so like the back half I haven't Even gotten into can we do this or not yet. That's like the economic modeling and stuff like that. We have the Excel models. I think it's going to be pretty quick to point Excel at this and then focus mostly on the mapping so far. Additionally, there's a lot of blank space for several reasons. One, we're currently operating under the most conservative approach in terms of Claude writing prose and doing any interpretation, which is Claude does nothing. Like, the only thing that it is writing right now are facts and figures that it can absolutely measure and verify.

Tucker Adams - 20:38

So, like, that is one main question that I have that we should discuss either today or in the future of how much rain do we want to give Claude to write some prose? Understanding then that you would still verify everything? Does that make sense? So, like, that's just to say there's not a lot of text in there right now because it's only doing, like, here is the fact, nothing else makes sense. Additionally, that's what we wanted.

Michael Byers-Norton - 21:08

Okay.

Tucker Adams - 21:09

And then the other piece is especially on slides where, like, you have pictures of the facility. There's some where I, like, wasn't totally clear on what the other diagrams were on slide. We're just skipping those for right now. And the last thing that I'll say is that some slides look better than others. I think it's going to be a process to clean up the outputs a little bit, but just like, you know, squint your eyes a little bit.

Michael Byers-Norton - 21:32

Oh, this is the stepping stone, right? Like, it's a. You already diving into that.

Tucker Adams - 21:37

That's all of the. The caveats. The bragging part is what we're going to look at. Like, the only thing that I effectively put in is the location. Like everything else, it is finding it. It's finding the maps. It's checking to make sure it's in the right place. It's like seeing, oh, this is partly unincorporated. Like, what does that mean for layering things on top of it? So, like, I am trying to get it in a state where at least the initial input is like, super automated. And then the work goes into verifying and putting the interpretation over the top. Right, as we discussed. So just, like, go through a little bit of it. All this is just blank space so far, but, like, it's making this.

Michael Byers-Norton - 22:33

From scratch.

Tucker Adams - 22:34

And these are just like the, you know, the most verifiable elements of the scorecard. Another primary topic, the first one being how much pros do we want it to write? Another topic of discussion is do we want to make a rubric? I think you said, you know, this is largely qualitative kind of your best judgment in terms of scoring right now. I think the process I would propose is I work with Claude, we make a rubric, we send it to you say this is right, this is wrong, with the understanding that ultimately it's going to be a judgment call at the end of the day and you're going to be.

Michael Byers-Norton - 23:15

Moving things around.

Tucker Adams - 23:16

Somewhat on record anyway.

Michael Byers-Norton - 23:18

No, I'd like, I want to work through that with you know, section by section, when the time is right. It could be now, it could be later, but I tried to do one of those recently on the power side and it was much more of a qualitative score, which I kind of really liked. It was a very interesting. It was like a confidence based scoring system, not a strict metric of physical distances and numbers of carrier scoring system. And to me that's incredibly nice comparatively. So it's definitely something that we should revisit. See if I can find it.

Tucker Adams - 23:51

Okay.

Michael Byers-Norton - 23:51

But yeah, can you just send me.

Tucker Adams - 23:52

Whatever you would made on that and then we can, I can kick it around.

Michael Byers-Norton - 23:57

Yeah, yeah. Let me make a note to myself to get that.

Tucker Adams - 24:00

So like it's making these tables just based on, you know, the best information that I could find. I don't have water or sewer yet.

Michael Byers-Norton - 24:10

Those are the hardest. Those are still the hardest.

Tucker Adams - 24:12

Research fiber in part, which is another question raised with you, but probably the simplest one which is where does your fiber data come from? Because it's not finding all of the lines that you have in the example report.

Michael Byers-Norton - 24:26

And fiber's the hardest one for us to address without starting to trigger real expense. So like fiber locator cost us like 2 grand a person per year. So it's not free by any means, but it's a, it's the fastest way to get decent data. So if we wanted to go further like this is, once we get done with everything we're working on now that's where we have

to sit back and decide if we wanted to get into an API based platform that has that data or not. And at the current moment I'm.

Michael Byers-Norton - 24:55

It's an example of one of the items that we want to keep human, kind of like the test fitting as well, where it's like when a deal comes in, I want a team to be able to run what you're putting together here and like figure out where you sit on that if you're part of the team running those things or if you're just the platform owner because you're the one who built the system. And then items that like when that task gets kicked off, it's also task getting kicked off to the fiber team to build out that research and a fiber team to do the test fitting and then potentially a team to start reviewing quality, assuring that kmz like, because that's basically we'll have the inputs, tasks that happen all at once.

Michael Byers-Norton - 25:33

And then once you start producing things with the system, that's where the QA will kick in to make sure we can present it and talk through it and be proud of it. That's kind of the dream I have right now.

Tucker Adams - 25:45

Yeah, that all. That all sounds good. I also basically just echoing something you just said, but tangentially related is we could build something that addresses, you know, 2/3 of the information in here and leave other parts manual for now and still like ship it. Basically. Like, we don't have to have the entire thing built out up front before it can be useful for some of the pieces. Right.

Michael Byers-Norton - 26:14

But then I'm just trying to follow your pace on that. I'm not, I'm trying not to muddy those waters at all. I want to keep you productive there.

Tucker Adams - 26:22

Now we get into the cool stuff because again, I didn't make any of this. I gave the address or I can't even remember what piece of location information, if it was a parcel ID or something. And then Claude is now finding the map, screenshotting it, adding the scale, highlighting the parcel, giving the property details. These are. These are you. But these are just like placeholders to match the previous slide. So that's where the parcel is. I'm trying to remember what the existing structure looks like.

Michael Byers-Norton - 27:05

That's specifically for a brownfield. Like that's a brownfield type of.

Tucker Adams - 27:08

Oh yeah, this is. I mean, and clause not freezing,.

Michael Byers-Norton - 27:14

That will always be an input that we put it in there. Right. And I noticed that the pictures are put in there as individual files. Claude is pretty good at it. But again, I'm not expecting this to be automated. Like just an example for brownfields. Yeah, we should be expecting there to be a bit more manual involvement.

Tucker Adams - 27:28

One thing that I want to note, this is an aside. I put it in the team chat. Also on the archive front were talking about, you know, every time Claude goes and finds something, it saves the file, it saves the metadata associated with it. It's going to index that file so that we can find it later. Right. The other piece of the archiving or data collection or like the Obsidian thing that we've talked about in the past is data that we get from the client, transcripts, etc. Right. Like we want everything to live in the same place. That is in the build plan. It's not in there yet. In terms of tooling, we could use Obsidian. I kicked around a little bit with Claude and Claude was basically like, we can just do this with SQL.

Tucker Adams - 28:22

We can build the Python script to just index the files that exist. And then because we're using Claude to go query it, you would just ask quad whatever question that you had and it would go find the pertinent files and information and answer it.

Michael Byers-Norton - 28:40

So like, so as you're reviewing these, start to think about that from a token perspective. I think that's part of the pitch of having indexed text based repository. I think that's part of the sales pitch of the Obsidian platform because it's indexable and it's all just markdown files. Like so it's not going through reprocessing PDFs to dig up research.

Tucker Adams - 29:01

I'll double check that.

Michael Byers-Norton - 29:02

Yeah, again, I don't know, that's just beyond my. But that thought popped in my head there. So.

Tucker Adams - 29:07

No, it makes sense. It's on my radar. I was like briefly working on it this morning before. I was like, okay, we can't be opening yet, but I think at some.

Michael Byers-Norton - 29:18

Point in time when you're done with this, we'll have to come back and look at it from a cost perspective just because we're probably going to get up to a couple of grand a month pretty quickly in API or cloud token type of costs. So I'm just trying to prepare my back ahead for that.

Tucker Adams - 29:34

Totally fair for what it's worth.

Michael Byers-Norton - 29:36

Yeah,.

Tucker Adams - 29:38

It is already in the build plan to like whether it's with Obsidian or just directly with Claude to have basically an ingest function that would do what you're saying, like text parse or whatever it is from larger files and index them. So like same page.

Michael Byers-Norton - 29:59

I'm just super flexible there. My whole point is just to make it effective. Whoever's managing it right now you're the one building and managing it, so whatever seems best. Yeah, I'll follow your lead on that.

Tucker Adams - 30:12

So this is another one that it just automatically built like put the shape of the highway over it. This is the site, these are the airports are in the area. Again, like I didn't touch any of that. Well, I just built it from like.

Michael Byers-Norton - 30:29

The table that's on that picture right now. Is that embedded in the picture or is that modifiable like that? The legend lower Left hand corner that.

Tucker Adams - 30:38

Is in the picture right now. But Claude has the files, like the layer files on its side. If so if we needed to make.

Michael Byers-Norton - 30:48

Mild tweaks to this is what I'm trying to say. Like that's something that will. Like, I'm just trying to think about it from a longer term like AI use perspective. Like, is it very easy to go in and say, hey, expand the table here on slide 12. The Legend right now is cutting it in half. I need to make that gray square and a legend a little bit bigger. You make the gray square on the northern era a little bit bigger. I just don't know how easy that is to fine tune. But it's something for us to keep a pulse on from a. Like if you have some like me coming in and review the final product and it's like I just ramble off all the things I need to see fixed.

Michael Byers-Norton - 31:22

How fixable are those ones when it comes to the images is the bigger dice rolls here.

Tucker Adams - 31:29

Two part answer. One, My plan is that I'm going to continue to refine the visuals on the baseline process here. So I've already kicked around. So it was putting text boxes on top of each other and stuff for the first part. So I think the initial output will improve. And I will talk to Claude Code about the practicality of saving these with the layers on so that we can do exactly what you're saying. Because it should be too complicated.

Michael Byers-Norton - 32:04

Just tag this manual. That's my whole thing. This starts to get too pedantic. Just like cool. Because otherwise the data grab is beautiful. And if analyst got this map and needed to put it into our final template, that looks perfect. That's still incredible. Time save and reduction across, right? Yeah. It's insane. Love it. This.

Tucker Adams - 32:26

So this is a clarifying question. Maybe I'm gonna say this out loud for Fireflies purposes and then we can come back to it. I'm going on a direction. Okay, here are the. Do you basically just recycle these? We have image.

Michael Byers-Norton - 32:43

And so this is also kind of something that we should be thinking about at a bigger level. Like you're building a lot of this to our legacy product and we should almost start calling a legacy product. Like I'm comfortable redoing all of this from a. How we present the data. Like, fundamentally, this is a good screen here because it gives you an idea of latency to larger markets. That's the whole purpose. And so we've been recycling it for Loudoun County. But that picture in the upper right, I Don't have that. That was at my fingertips. And that's a huge. Like, we had AI be able to build those type of maps and put the logos on there. Holy fuck. That's amazing. But that itself is a massive project that only brokers really own and do today.

Michael Byers-Norton - 33:22

So, like, the purpose of this screen is supposed to be, here's where your tier one markets are, here's how far you are from the tier markets. Tier one markets. Here's why they're tier one markets, and then here's the latency tool that's like, we can present this any way we want. And I'm very comfortable. Like, when you showed me those first images, like just the parcel overview map that was produced, that looked a lot more professional than this. Right. That came off as like an engineer.

Tucker Adams - 33:48

Yeah.

Michael Byers-Norton - 33:48

Consulting services, quality document. So I'm very comfortable going through this template effort with you in that regard and communicating the knowledge better than this current format. Okay. Yeah, but, yeah, so I didn't mean to derail it there, but that is.

Tucker Adams - 34:04

That makes sense. Like, I think, yeah, the majority of the work that I've spent so far has been on getting the pipes to be able to get this information and put it, you know, on a slide. To your point, I've been largely basically saying, like, let's remake this deck. I can loosen the reins a little bit on that and say, like, are there other ways that we could be presenting this information? But I think basically all of the work that has happened so far has been product. Like, I don't think that negates really anything that we've done so far.

Michael Byers-Norton - 34:42

I'm just more putting it out there because I'm very happy with what you're doing right now. From a. That's what we talked about perspective. But the same piece, if it does start to get. Just to be a bit like, why in a moment. It is definitely something we could be tweaking and adjusting to make it appropriate as needed. So.

Tucker Adams - 34:58

Okay, totally makes sense. This is another one. This is fiber. This is another one where like from a public database, it only found. And I mean, this needs like legend, et cetera, like, again, work to be done. But I think it found Zio and Fiber Light is what it called. Right. We'll come back to the correct way.

Michael Byers-Norton - 35:29

So this one here. Yeah. Right now what I'm trying to do for these is keep it manual. Ish. Because if we. If we just meet what the market is today, that is the fiber locator review. That's it. Like, we can just Snapshot. The Viber locator review. I've been getting really too trusting. I've been trying to stress cloud out where I go through and do my fiber review and build a word doc, not even making it well organized. Do my recording of myself talking through it and dump both those things in the cloud. Say, build me a deck. And it just takes the images I took a snapshot of

and embeds them instead of recreating the images. And I think for fiber, that's likely going to be the easiest thing to do.

Tucker Adams - 36:06

Like power.

Michael Byers-Norton - 36:08

Yeah. Automate the fuck out of that because that's brilliant. That's so much time for us to do that manually. Like, great. This looks great. Yeah. Like, this is the table of contents in there and we're shipping this thing out the door, right?

Tucker Adams - 36:19

Yeah.

Michael Byers-Norton - 36:19

So it's a. That's great.

Tucker Adams - 36:22

It has generation, it has. These are transmission lines. Right. And then this is the. The local version of that. The like, zoom in version. Although this looks like the Orient. Oh, never mind. It's just a. A broader version of what I'm used to looking at.

Michael Byers-Norton - 36:41

Yeah.

Tucker Adams - 36:42

But yeah, this. This is automated pipelines.

Michael Byers-Norton - 36:49

Awesome.

Tucker Adams - 36:50

Blood planes,.

Michael Byers-Norton - 36:56

Dude.

Tucker Adams - 36:58

Wait, that's the ship.02 acres.

Michael Byers-Norton - 37:03

Is this showing?

Tucker Adams - 37:06

Oh, yeah, this is the. I think we need to zoom in on this. This is the part that I haven't, you know, gotten far into yet.

Michael Byers-Norton - 37:12

But yeah, topography around the site's kind of useful too. Like, the soil is good for the site, but getting a little bit of topography for the buildings around it so we can see if it's downhill or in a valley or something. But those are. You're already triggering me because, like, the image is so useful. It's like, all right, let's put it to work. You know, at the moment, this is good. This is very good. Yeah. But I mean, the soil details with the.

Tucker Adams - 37:35

If we're doing the soil here and the topography here, like the pipes are there, we just need to have it. Apply that to the area around it as well.

Michael Byers-Norton - 37:44

A little bit tighter. Delete the site parcel name, but keep the right outline. You know, small things. This is still a shit. Like, this is. This is going in a really good step.

Tucker Adams - 37:54

So. Yeah. So I think in terms of big decisions right now, for the time being, we keep it. Claude's not writing any pros. We leave that to you. You're quick at it. Like, you can knock it out for fiber.

Michael Byers-Norton - 38:10

I hope it's still just to record the pros. Like, that's my hope, is I can always talk through it on a call like this, like, you and I would literally scroll through this deck. Right. Scroll through this with Davis. Yeah. And we'd record our thoughts and then dump that back into this quad to say, hey, go ahead and update this based on this feedback and opinions.

Tucker Adams - 38:28

And that's already, like, in the process that we have been working off of, is the idea that you, like, you run it once it does what it can automatically. There's going to be pieces that we know that it can't do automatically. Like fiber. Right. You're gonna put those in. It's gonna get to a. This is what I think the report looks like. And then there's going to be an additional, you know, as many verification steps as needed to then say, like, that's not right. Fix this, whatever. Before we ship anything.

Michael Byers-Norton - 39:01

Yep, that's what I'm expecting.

Tucker Adams - 39:03

Yeah.

Michael Byers-Norton - 39:04

That's beautiful.

Tucker Adams - 39:05

So that's. That's where that stands. I'll try it. Let me look back at my notes and see if there are any other major questions that I had.

Michael Byers-Norton - 39:14

Where are you?

Tucker Adams - 39:15

I. So my girlfriend moved in, what, like a month ago at this point, before went on our trip, and brought her own furniture. Also brought her own computer monitor. So then I was. Just had an extra computer monitor sitting around. I was like, do I put this in storage or do I just get another monitor arm and have a battle station? So now I have three monitors with, like. Realistically, I'll never need three monitors, but we have them. I was like, why would I put this away when I could just put it on my desk?

Michael Byers-Norton - 39:50

Amen. So I just saw my brother move, and he was that same point. He had the three monitors going in a laptop in front of it. It's just like. Yep, yep. It's just a burn power, baby. That's all it is.

Tucker Adams - 40:03

Now. I don't feel as good about that, but that's okay. Yeah, I mean, I think those were the major things that I had to discuss. And I'll.

Michael Byers-Norton - 40:17

Yeah, I'll.

Tucker Adams - 40:18

I'll keep chugging along. I think, honestly, it's gonna. It's gonna streamline things to not be worried about power and just. Or, sorry, fiber. And just have that be, you know, manual for the time being. So good on that front. Do we want to switch over to new or wait. Yeah, okay. Do we want to switch over to new Echo? Is there anything else you want to chat about on this front? Is this matching division?

Michael Byers-Norton - 40:51

Yeah, 100. Like the. The ledger into the draft and then into the ability to QAQC it and Ledger being that source of truth of what's been QAQC seems to be the game. Right, right. And that's really it. Those are the things that I think are required. And as soon as you feel comfortable running through a test example of it, we can start really poking holes. But I'm trying really hard not to micromanage or derail you while you're set you and forget you type of moment is a. What is that from shamwow set it and forget it, you know type of moment or Flex tape. Yeah. But still it's nonetheless, yeah. I want to enable you running the way you're running because this is powerful.

Tucker Adams - 41:32

If there is stuff that you are seeing, it's like yeah, it's not. That's not it. That I have not already caveated is like good.

Michael Byers-Norton - 41:40

So the derail. So this is my. And this is where you just check me. Because it's, you know the way I think right Where I'm at right now is from the like how do we stay dynamic on the solution front but no we can deliver on the back end and then how do we take the same ability you're doing right now and make it something that we can be providing as part of our every single site review process and our venture management services. Because we have three to four accounts in the funnel that and ones we have already a book today that are multi site clients. They're

paying us on a retainer. And so it's. There's going to be specific things that we need to create a la carte all the time.

Michael Byers-Norton - 42:19

Like it's going to come and go from a scope of work perspective for reports but also internally if we're reviewing new sites. Here's the things I want to check off and address. Your ledger shows that you're thinking the right way there. Cause it is just something from a line item perspective almost we can pick and choose to use and run with. And that's kind of where I'm trying to explore that in my head right now of if I have our like our services guide that has a shitload of different services in it. Right. But if I read through these services, each one of these is still at the end of the day just a handful of fucking assessments taped together. Like even when I'm inside the esc it's just like great. Here's realistically the five data side things that we're gonna go grab. Right.

Michael Byers-Norton - 43:05

Like each one of these still breaks down an individual line item type of items that we're then taping together and putting into that templated product. And so if I'm like doing a full deep dive review of a site, I'm gonna have these key deliverables plus these deliverables plus these deliverables. Right. Like they're all still kind of broken into what's the research, what's the method, what's the presentation? Because it, if I think that way, our products are still just taping together different sets of research and knowledge.

Tucker Adams - 43:34

Can I. Yeah. Take a shot at where you're headed and then address it. If I'm right, is the thought like it looks like we're building a single process to do all of the same things, you know, for a pasa. Like we have all of these other types of reports or other types of things that we might have to do on a one off basis for a, you know, retainer client, et cetera. Like how does this work with that? Is that part of what's in your head?

Michael Byers-Norton - 44:08

To a degree. Right. So if I'm thinking about it like we're doing these for our own sites, we're doing these for new Edge co sites that we're actually owning, operating and developing and we, I want to believe in our process and methods. Like I still think if I'm going to believe in a site, even if we're investing ourselves all these items I still kind of want to address. And the passive does it right. Our current abilities do it. But for every site that we really believe in on the feasibility side, we should be able to answer those four questions. And we have different ways that we try to approach answering those four questions. But the product itself is attempt to productize that approach.

Michael Byers-Norton - 44:44

But at the end of the day, you and I, for every site we look at, we're still going to want to answer those fundamental four questions to be able to defend it. And if it's internal, it's going to look potentially differently. It could be the exact same product internally. But it's just one of those of trying to figure out, you know, as long as we know where we're getting that information from, the ledger is perfect because it forces us to validate where the info comes from. We know the methods of what we're doing and that really is critical or why we're making these opinions, why are we scoring something?

Michael Byers-Norton - 45:14

Why does the model show this like those three things that are a bit more real IP related that we start to be able to defend and then how do we present it is the other piece on it and that's where right now we're trying to do it through these reports, you know, fundamentally. But if we're supporting clients where they're bringing us 15 sites all the time, we're going to be picking and choosing. So for example server domes right now knowing where they're at in their current program or they want to buy sites varying quickly so people are bringing them powered land sites.

Michael Byers-Norton - 45:44

We kind of need to do a variant of all these things and it's almost like when I go through to create a scope of work form I'll be pulling these different items for that scope of work and that's going to then in theory roll into the AI machine to do something but it's. It changes us from being strictly to these reports. But now you're more into like those sections of those reports become tools that we can put together for any solution that we're trying to work for a site. Is that too high level bullshit? Does that kind of make sense?

Tucker Adams - 46:13

No, no, it makes sense. Several thoughts that I will ramble through. One is I think the things that we're doing. The output is maps but the underlying again like pipes are finding these layers, finding you know, where the transmission lines are across the US Seeing distance to them, seeing capacity etc like that is actual important information beyond just putting something on a pre slide.

Michael Byers-Norton - 46:44

Yes.

Tucker Adams - 46:46

If I'm thinking soil composition and topography, I think right now we're putting it on pretty slide. There's not a level of interpretation that says therefore the cost to move dirt is going to be X. I think that can come that layer that I just said. The cost to move dirt can be built on top of what we have here. But I think it's still progress on that front. I think building a good scorecard is going to be critical for the what do we actually believe especially for our own sites or for a systematic review of the 20 sites that a client brings us. So I think that will be not surprising a key piece of work for you and I to do together. I'll also do make another plug. Wait, did you send me what you did on the rubric front already?

Michael Byers-Norton - 47:45

No, I couldn't find it. I need to take my time and dig it up so I put on my calendar to do that here in a couple hours. So.

Tucker Adams - 47:50

Okay. So I think there's always going to be some level of qualitative analysis which is why you especially are going to have to be in the loop for especially anything that looks like us taking a specific interest individual sites and we should be applying that same level of rigor at least like coming at it from the same perspective when we are advising others on their sites. Right, Exactly. So I think all of the underlying machine that we are building and the process that we are building is still correct for the things that you are describing. And right now the output focus is on visuals and there is a additional other layer of output focus of like analysis which is part of what you are describing in terms of costs, etc. And I haven't gotten to that piece yet.

Michael Byers-Norton - 48:52

Like you're fine.

Tucker Adams - 48:53

We're building the foundation that's going to be shared across them and right now we're making it look pretty and additionally we will do the analysis on top of it.

Michael Byers-Norton - 49:04

Well, and you're also heavily learning how much we can do it as a one big system versus piecemeal. Like you're diving in proper and exploring it in an incredibly accelerated manner. And so like I just bumped this in your inbox one more time. Like, and I don't want to get sued for competition type of things, but we don't have any agreements with these guys. But it's like when I look at their products, you know when you showed me that one quick snapshot previously of how were reviewing a parcel Bounds and it looked more professional than this screen right now.

Tucker Adams - 49:32

But this is like this is a product that they ship.

Michael Byers-Norton - 49:35

Yeah. I think they get away for free to try to get people into the door to do the same. Terabyte does. Like it's. But this is direct competition to us. Right?

Tucker Adams - 49:43

Like, yeah, on the map front, ours is going to be better than that already.

Michael Byers-Norton - 49:48

Yeah. So it's like, all right, it's easier for us to tackle and address but it shows kind of where the bar rests. But it's that same concept of like for research purposes. This is great. It's overwhelming as. And that's where our products are scoring. Our guidance is where we add real value. But you're exactly right. Like if we had the research correct and it was easy to verify and then easy to deliver. Like we don't have to make it all just in that one report format. So that's kind of where like in my mind we have that research piece. It's verifiable and presentable. So if we're just doing our own internal data room, it's just a stack of these files, one big ass file like this.

Michael Byers-Norton - 50:22

But then if we're actually doing the analysis on it, that's that scoring system that you and I need to work on. And Just have you rip apart our current approach and help us put together a good one. And then on the product side is what you're looking at for the passive. That's our attempt currently to productize and generate revenue through that effort. And it's always that debate of do we just stick with those four reports, which I think we should. But also knowing that there will always be a gentle push to customize those, which is where your line item by on the ledger front is like a beautiful, inspiring piece. Like as long as we have that knowledge, we can decide what to do with the knowledge, how to produce something for it.

Michael Byers-Norton - 50:57

I think right now, like that's kind of where I just see this being a very dynamic tool at the end of the day. But the swim lanes and processes that you're building right now, I think directly apply. Like it's for sure you're building the bones and framework 100% for what it's worth.

Tucker Adams - 51:13

Not because I have the computer engineering knowledge to fully direct this, but pushing Claude code to build this in a modular way. So it's like all of the pieces of this are their own processes that then get called when you are building this as a single output. So it's not like we're going to have to go back to the drawing board to do one piece of this at a time.

Michael Byers-Norton - 51:36

And anyway, I think yeah, Sub agent for power. Sub agent for Power analysis. Sub Ninja for Power presentation. Maybe I don't know big words there, but buzzwords for the win. But anyway, that's just me. Brain Sermons. I love where you're going with it right now. I think for what we're trying to accomplish here in this current pass, you're on the right path. But again, I don't want to micromanage or derail. I'm just showing you where I'm getting hyped as and getting more and more excited to wield this across every type of project we're working on because it's such an efficiency improvement type of item.

Tucker Adams - 52:06

Yeah, let me ask you this, and this is a half foreign question. So if it turns out to be wrong in its basis, apologies, but like we said, currently focus on the output of visuals, maps, etc. There's the other piece that I am largely grouping into analysis. You know, what are the costs associated, what is the financial modeling, etc. Would it make sense to focus on the analysis part first?

Michael Byers-Norton - 52:38

No, I think the research piece is perfect. Right.

Tucker Adams - 52:40

Because I'm just saying research pieces consistent across both of them. It's more about is the output a map or is the output feeding into a financial model?

Michael Byers-Norton - 52:50

So if right now let's do it incrementally. Right. If your initial output is into a document. So a map with statements on it.

Tucker Adams - 52:58

Yeah.

Michael Byers-Norton - 52:58

That way when you review that very quickly, it's just a quick. This is correct. If it's correct, it's in the data room. It just becomes an artifact right then and there. That's super valuable because then you're building now the information that can go into analysis or go into a presentation. And so that's kind of just the stepping stones way I look at it, because you and I are gonna be using this data 15 different directions. Right. And that's the point. That's kind of like the dream of it. We'll have people who want consulting and guidance and education. We'll want people who want an artifact in the data room that they can use for justifying investments or justifying sale of a parcel.

Michael Byers-Norton - 53:33

And then we'll want to have the stuff that you and I are dangerously getting very close to having your fingertips, which is the internal business case, to know what the fuck to do. So variant to the passion, which is consulting nature versus shit. We know these guys are willing to throw money at this now. Oh crap. How do you want to chase this? You know? And we're fast.

Tucker Adams - 53:53

Yeah, this shit's cool, man. Like, I think what like listening to the things that you're describing of like maybe we just want to be able to point somebody to the underlying data file because they want to follow up on something like that is what I'm thinking about when I'm building this file structure of, you know, what are all of the calls that we made to get to this thing. And here's the whatever. So I think we're putting together something pretty powerful. And that's the pat on the back that I will end this segment with. Also, do you have a hard stop in five minutes?

Michael Byers-Norton - 54:35

Yeah, I gotta go schmooze this guy. So we should give a new edge go time on the calendar. Like, what's the rest of your day.

Tucker Adams - 54:40

Looking like for new edgeco flexible?

Michael Byers-Norton - 54:45

Do you want to just gonna be talking. Okay. Like when is best for you? So I don't up your routine. I'm free from noon to 3 and then 4 onward.

Tucker Adams - 54:59

You want to do like, you want to just do one. Perfect.

Michael Byers-Norton - 55:17

But yeah, there's a bunch of updates there. And I talked to rare side real briefly last night. He says it's going to be two or three weeks until we can properly start talking to the right people at Unity for the current carrier block. And he tried to explain to me that he made a mistake on which sites were looking at versus not the ones were looking at. Like didn't really understand what the he meant there. Okay. Like those are the bottom 200 sites or those are the top 200 sites.

Tucker Adams - 55:43

And something there was averted the 200 worst sites.

Michael Byers-Norton - 55:47

I think it may have been the 200 best sites. So I thought that was the whole thing. Are you guys trying to keep these then or like what the. Yeah, that's why I couldn't quite get the point he was making. But most importantly his main contact is going on vacation for two weeks and so. And he wants to talk to her boss but he knows that she's still the one that makes all the decisions around this. But it does highlight that we need to figure out our game plan internally there which two weeks is actually probably helping us a little bit if we're trying to line up solutions. But

also if we're going to go hard in this paint I think we need to exploit enabled. We need to exploit Ultra Digital. Who has a path into AT&T's ecosystem this way.

Michael Byers-Norton - 56:25

We just need to decide the extent we're willing to dive into it or not. Because you're seeing right now this could be a distraction if we're trying to do it directly that way. Whereas you're currently building a machine to make it an investment tool to go after those portfolios and sites and we just wait for them to come in and go out and execute them. I think we're at a very good inflection point for having the current Unity program moving in a way that we can manage three different paths on that semi safely but then figure out how crazy to go or not go essentially on the other path because it's just how do we apply this knowledge and yeah like it's.

Michael Byers-Norton - 57:03

So that's a lot more to talk about and start to like put down properly here and just align on where your head was at and kind of where my head's at currently on it. But yeah, the triple point guys are raising funds. Crazy man. Like there's. There's money for us to have access to right now if we want to put together cases and especially on a deal by deal basis, they're very big up.

Tucker Adams - 57:21

So I sent some like preliminary thoughts on things that we either should discuss as questions or that we might need to or want to bring to a conversation with those guys or some other investor. It's in teams. We can talk about it again in two hours.

Michael Byers-Norton - 57:43

Perfect. I'll read that ahead of time. So I get 30 minute prep on that and then resync with you. Dance appropriately, man.

Tucker Adams - 57:49

Sounds great. Ready?

Michael Byers-Norton - 57:50

All right. Appreciate it.

Tucker Adams - 57:51

Talk to you in a bit.

Michael Byers-Norton - 57:52

Talk soon. Later.
