

Michael Byers-Norton - 07:40

Hey, sorry about that, sir.

Tucker Adams - 07:44

No worries at all.

Michael Byers-Norton - 07:47

Got talked into doing a quick site review this afternoon, so. Good shit though, man. All good shit. How you doing?

Tucker Adams - 07:58

Feel like I'm fighting my computer today. Usually we're on the same page and today it just feels like it's really struggling, but I think we're gradually winning together.

Michael Byers-Norton - 08:11

If you hit a rage point, let me know. We'll just get you a quick emergency computer.

Tucker Adams - 08:15

Go. The. The computer is typically fine and it's a. Like, it's not a notably beefy desktop, but it's a desktop anyway that moving stuff around on it identified some other, like, coding ship that I had to figure out, but I think we're most of the way there anyway. You want to download from the call?

Michael Byers-Norton - 08:44

Yeah, anything, dude. Like, you and I have been not Sync up efficiently, but this week, like, it's just been chaos on my side.

Tucker Adams - 08:53

So my desktop client was just not working yesterday. Like I. We should have been able to Sync yesterday and none of the messages seem to be going through, so that's. That's on me though.

Michael Byers-Norton - 09:02

You're always good to shoot me a text or give me a call because I. When once my brain shuts down, I get done with calls in the afternoon, I tend to off pretty hard. Yeah, but it's more just an add thing than me putting a wall up. So if you ever do need, like, don't. Don't be a stranger, man.

Tucker Adams - 09:16

Try.

Michael Byers-Norton - 09:16

No, that same piece, I don't think that was yesterday. I think we're good, but just, you know, you're always safe there. But yeah, the enable call I thought went really well from where I'm sitting.

Tucker Adams - 09:25

Yeah.

Michael Byers-Norton - 09:26

Like.

Tucker Adams - 09:27

Yeah.

Michael Byers-Norton - 09:27

What's your vibe?

Tucker Adams - 09:29

I think they are definitely engaged and definitely interested and definitely willing to take fees to push sites through. Do you think that they had a good read on. I mean, still, when we're talking about a kind of mass transaction of 200 sites of minimal diligence, there's not that much of a lane for you and me there. And there's not that much of a lane for enabled. Right. Am I. Are we thinking about that in the same way? That's more of a.

Michael Byers-Norton - 09:59

Like more of a. There's more of a line for you and I than there is for enabled on it. For sure. Like it's. But it's still not massive. Like it's just a quick transaction, get some points on it, get out of the way type of moment. Like, it's definitely going to be one of those, like, type of dreams. So It's. It really gets back to if new EdgeCo can control the sites or have a path to be like representing that deal, then we're able to dictate what we need out of it. The groups who are going to be working with to drive the site are the ones that own the optic relationship and potentially putting the funding up. So we should expect significant percentages to be leaving our hands on it.

Tucker Adams - 10:37

Yeah. Realistically, we're not doing that much work on it. Right. Like we're. I think it is understandable that most of the percentages would go elsewhere.

Michael Byers-Norton - 10:48

Yeah. The work we're doing is going to be able to be talking to the carriers and getting them on board and that's the slow and steady type of effort.

Tucker Adams - 10:55

Like it.

Michael Byers-Norton - 10:55

Because this is again, like it's not a traditional transaction. But yeah, because I saw the email from the CBRE guy for AT&T. Right. Like, yeah, that's a good example of what we should expect from every carrier is a bit of wishy washiness and lack of competency because this is not their core competency.

Tucker Adams - 11:14

But honestly that's like an interesting distinction that you're making right there. Because I was still thinking that, I guess there's. I was thinking that there were. That two opportunities were the same thing and in fact they're separate. We're still talking about the, you know, a bundle of like 200 or 100, whatever the number is, a bunch of carrier sites. Right. There's one way we get to that, which is Rare side already has access to it and already pointed us to it. That would be basically us putting Rare side and not Path one triple point in the room together. Right. Well, actually triple point buyer in the room together. Alternatively, the other thing that you're describing is like we have a direct link to the carriers.

Tucker Adams - 12:04

We're not going through Rare Shy for these, but still we're doing minimal diligence on them and we are basically getting other people to shake hands. Am I thinking about those two separate ideas the same way that you are?

Michael Byers-Norton - 12:19

Repeat that one more time, dude, text pop up. And I didn't follow that second point. So.

Tucker Adams - 12:23

No, you're good. The first one is I was thinking that the only source for a large portfolio of carrier sites that we do minimal diligence on. Right. I was thinking the only place that were expecting those to come from was Rare Shy.

Michael Byers-Norton - 12:46

And at that point absolutely not the case. Like just the immediate opportunities of Rare shine. Correct. Right.

Tucker Adams - 12:52

And so there may be an immediate opportunity with Rare Shy but realistically, the only lane that we would have is playing the telephone game between Rare shy to us, the triple point to triple points investors. Right. Versus, if, in fact, if we get a direct line on carrier portfolios, it could be more worth our while to. I mean, we're still largely playing the telephone game if there is minimal diligence that is going into it. But we would be the ones bringing access to that carrier as opposed to just bringing access to rare shied, which is open.

Michael Byers-Norton - 13:36

Think that makes sense?

Tucker Adams - 13:38

Yeah.

Michael Byers-Norton - 13:38

Okay.

Tucker Adams - 13:41

Maybe just to make sure that we're on the same page, I'll turn it around and ask you for your spark notes on like, for the deal where one side of it is selling or enabling a sale of 200, let's say carrier sites or just general small sites that we have done minimal diligence on to triple points investors. Right. Because they've. They've expressed interest in a transaction like that. That's one side of the deal. Right. You with me so far?

Michael Byers-Norton - 14:15

Yes.

Tucker Adams - 14:16

Where do you expect those sites to come from? And there could be multiple answers to that.

Michael Byers-Norton - 14:25

Just like the portfolio play is what you're talking about, right?

Tucker Adams - 14:27

Yeah.

Michael Byers-Norton - 14:28

Okay. So basically, when we first had engaged enabled Lumen had brought them a portfolio of sites that they were consolidating down. Yeah. And did it for one city, just for Minneapolis. They brought them like 96 sites.

Tucker Adams - 14:41

Yep.

Michael Byers-Norton - 14:42

And they're like, of these 96 sites, two of these are going to be the ones we keep and consolidate into. We're thinking about divesting the rest. So that's an example of like, that could have been a portfolio play there, Right? Yep. And so that was one city. They plan to do that for two more cities relatively soon. And if that program went well, expand that across the portfolio. Yep. So that was just for Lumen. Right. So that quickly gets to a couple thousand sites, just like what Unity is doing.

Tucker Adams - 15:10

Yep.

Michael Byers-Norton - 15:11

And that's it. So those are the opportunities. That's the access to the portfolios, the sites, period. You know, the sites that move on to being the opportunity to do a bulk divestiture. Like we need a better term for this machine. Those are going to be the ones that we propose to bring forward and period. Just bring them forward as that bigger portfolio play.

Tucker Adams - 15:34

Now pause there when you say. Or maybe I'll play it from the. From the opposite angle. I was under the impression that if we're talking about selling a hundred sites at a time, that it 100 sites at a time. Two triple points buyers. Right. Because that's who we had identified as a offtake demand for that kind of transaction, right?

Michael Byers-Norton - 16:03

Yes.

Tucker Adams - 16:03

If we're talking about selling 100 sites at the same time. My understanding was that triple points buyers expected to do their own diligence and would just be basically transacting on the whole thing with them taking the risk of some of these are going to be stinkers, some of these are going to be really good, some of these are going to be in the middle, Right?

Michael Byers-Norton - 16:21

Correct.

Tucker Adams - 16:22

And so when you just said in a mass transaction scenario that we would be identifying the winners, are you saying we would be identifying ones to carve out for our own purposes or are you describing. Go ahead.

Michael Byers-Norton - 16:41

No, it's a two edge thing. So like we need to figure that layer out of how much we have to do. I think at bare minimum if we have the automated program you're putting together so a data room can be populated for each site with a couple documents, like just a couple overview, like here's where the power is, here's where the site is location wise, you know, here's the size of it building and like basic units that a buyer can look at in mass that we're doing in an automated manner. It gives us the chance to also filter out the sites that are clearly not a fit. Like going to be the small island huts that are just a tough shed with no land. And so that's kind of I think the goal in my mind. And I could be overstepping here.

Michael Byers-Norton - 17:20

This where it might be overdoing it, but every site screen should have a basic initial assessment on it.

Tucker Adams - 17:25

Okay.

Michael Byers-Norton - 17:26

And that I think makes sense. Just we're helping these guys get that transaction done. And in theory terabyte can do a lot of this automatically. And that's again, I might be wrong, might not be wrong, but if I'm a sales engineer trying to pitch this portfolio, gonna need something to pitch. Right. Not just be giving them sites that are going to trigger them. If they pick ten sites out of a thousand and two of those sites happen to be shitty. Clearly a no go site that could disrupt the entire negotiation. But if every site they poke at is something like I could see that possibly working, then I don't see any real pushback on the acquisition thing. Okay. Because yeah, that's kind of where my head's at. A product unit. Yeah.

Tucker Adams - 18:06

No, no, it's a good refinement because I. We have had the exchange that triple points buyers expected to do the majority of the diligence themselves. And I interpreted that more globally to mean like we just hand in the whole list and they go find. They identify the ones that they think are stinkers or potentially that they were just like we'll buy the whole thing knowing that some of them are stinkers. And then we're only counting on hitting 25% of these as really good sites. Anyway. What you're saying instead is we are doing enough diligence to say the list that were handed is a thousand sites. We think that really you should be looking at these 100 and then maybe they actually buy 50.

Michael Byers-Norton - 18:53

I think so. Like my goal is to make it so the hundred that they're looking at, they buy a hundred because I want the sites to fit enough of their criteria. Okay. Like in other words, just space wise and within distances of each other wise.

Tucker Adams - 19:05

Yep.

Michael Byers-Norton - 19:06

That it's a no brainer, they're already clustered type of space.

Tucker Adams - 19:09

Do we have a good line on what those metrics are already or is that like a conversation that we need to have with. With the triple point guys? And also, I apologize.

Michael Byers-Norton - 19:23

No, we definitely. I don't interrupt you all the time, dude, don't care. But no, it's more on the front of I'm making up those assumptions.

Tucker Adams - 19:29

Okay. I think they're gonna want you to make up most of those assumptions. Like they're gonna default to you on what they should care about because that is how they interact with you already.

Michael Byers-Norton - 19:44

So the way I'm looking at it is if we have enough land space to drop in modular units. Yep. Then we have enough to play around with. The gap right now is, you know, I don't know the kilowatts per modular unit that they're targeting.

But if we make that initial assessment, like I need 2 acres with 1 acre free, that's enough for a make watt. Right. If we have some rule of thumb that we need to apply for a filter machine here. That's my goal.

Tucker Adams - 20:08

And I mean we can make that machine quick. The guts of that already exist. That would just be sitting on top. Like ingest this CSV full of sites and tell me how big.

Michael Byers-Norton - 20:22

Produce a picture with an ability highlighted parcel. Exactly. We can do that from data that's out there. Like if we need to buy a better system to get better visible data. But yeah, it's just. That's enough to start, right?

Tucker Adams - 20:35

No, I think that exists already. So that's good on that.

Michael Byers-Norton - 20:38

So if we pick. Yeah. So just imagine pitching that like, hey, we have these 12 sites within this distance from each other from a mesh perspective. They all are over 2 acres with an acre of buildable land and they have buildings totaling 200,000 square feet when aggregated together.

Tucker Adams - 20:54

Yep.

Michael Byers-Norton - 20:54

Like to me that's enough. Or if I'm making a risky assessment and commit. All right, like you've checked all my boxes, they're entitled to power, to fiber. There's multiple space and they're within distance of each other. Strategically.

Tucker Adams - 21:06

Yeah.

Michael Byers-Norton - 21:06

The only risk then is how much power can we actually get upgraded at the site. That's the risk we want them to take. That's why it's a bulk purchase at the moment.

Tucker Adams - 21:15

Yeah.

Michael Byers-Norton - 21:15

And I think that's the productization I have in my head of being able to make this efficient. Because I think with our automation that you're working on, we should be able to handle that degree of the pitch for sure. And if we can produce professional engineering looking documents in the data room of it, we can help fill in the gap that these carriers don't have data like they have nothing there that's useful to really help us on it. We shouldn't expect much. And so the only cost that is probably going to pop up and bite us is the title survey to make sure we can legally get through the acquisition.

Tucker Adams - 21:49

I have no idea what the automation potential of that is. So I.

Michael Byers-Norton - 21:54

No, it's third party, it's insured entities. We have to hire title survey groups.

Tucker Adams - 21:58

Okay, easy peasy. That, that there is not an automation factor here. Okay, I'm gonna ramble for a second. Largely for Fireflies purposes. So I have done some organization work on the, on my end just trying to you know, get the various opportunities, supply, demand, etc down on a page. I think there are multiple and like trying to think through the right way to organize everything. And I think there are various deals that we have been describing at various times that include some combination of who is the demand, like who's asking for it. What would the transaction look like? You know, is it 10 sites that are already developed and have a container already on them? Is it a hundred sites? They're just land. Right. Like there are various stages of potential project advancements that various offtake is looking for. Right.

Tucker Adams - 23:06

And similarly there are also various sources like we've been discussing here that like if we're talking about a portfolio of 100 sites in the immediate term that could come from rare side you in the longer term, ideally we have our own carrier relationships and we are the ones sourcing those sites. Right. So it's like who's the supply, who's the demand? What? Maybe it's just project stage and size of portfolio transacted is kind of the shape of the deal. And so I think the way that I'm going to go back and organize this is in terms of deals and a deal will have some combination of those factors. Supply, demand, deal shape. Right.

Tucker Adams - 23:56

And then I think at least for me, it's going to make it easier to keep track of all of these various threads and as we add to it's going to make it easier to keep those straight as well. Because just like with today as an example, I think you could have, you could kind of track two separate deals in terms of supply is rare shy deal shape is high level large portfolio transaction with minimal diligence buyer is TBD or sorry, triple point buyers. Right. There's another deal, maybe it's a sub deal, whatever, we'll figure it out later. That is most of the details of that are the same but instead of getting it from rare shy, we're getting it directly from a carrier. Right. And maybe that impacts the type of.

Tucker Adams - 24:48

Well, that certainly impacts the upfront type of work that we would have to do, namely having a relationship with the carriers. And maybe it affects the diligence to some degree because we're getting different information from the carriers than we would be from rare shot. Right. That was most of my rant. How does that sound to you in terms of just keeping our ducks in a row to organize it in terms of deals and or sub deals and each deal is some combination of where the parcels coming from, who is demanding them and what is the shape of the deal that we're talking about.

Michael Byers-Norton - 25:31

Make you think of the right way. Cool. Okay.

Tucker Adams - 25:34

I think we have most of the pieces already and it's just a reorganization of those pieces. And I can shoot you what I Claude come up with later this afternoon on that front. Okay, that was my logistics get things right in my head step for the triple point one specifically because correct me if I'm wrong, but I think that's the most immediate piece. And then I'm saying this out loud so that you can keep me honest because I want to come back to what we just discussed with the enabled guys. I think the work to be done for the portfolio sale to the triple point buyers is take the rare side list that we already have and build a machine to get additional to get.

Michael Byers-Norton - 26:31

A first pass.

Tucker Adams - 26:34

Data room. And I'm putting that in quotes for each of those sites that at least includes an image of the site and the size of the parcel and anything else that you tell me you think is quickly automatable and also very important. Maybe a map of where all of these sites are relative to each other.

Michael Byers-Norton - 26:56

Yeah. Like the KMZ you produced was pretty awesome. Yeah. Because it did capture a lot of those items.

Tucker Adams - 27:03

Yeah.

Michael Byers-Norton - 27:04

And so if we're building either, we just keep the KMZ included as it is and say that's where your power details are. It's probably the laziest step if we were going to get a little more detailed on it. Yeah, great. Give me a PDF clean engineering type of drawing that shows the distances to power infrastructure and give me a, you know, a map overview of where all the rest of the sites are. But that's if we wanted those to be separate PDFs versus just a KMZ so. But yeah, we're expecting incompetent people. Yeah, separate PDF helps a ton for those things. Yeah. Okay.

Tucker Adams - 27:36

I like that. That's straightforward. Sorry, I probably jumped in there too quick. Is there anything else that's on your radar there before I go on to the enabled ones?

Michael Byers-Norton - 27:49

Yeah, I think that's enough to get us in trouble. A real quick note though, on the. The Unity Windstream sites. Rare shy. Did he say something confusing to me last time we briefly talked? Okay. That apparently the 200 sites that were looking at are actually the top 200 sites for Windstream, which I don't know what the that means.

Tucker Adams - 28:10

Yeah. So I remember you saying that he was ambiguous about that.

Michael Byers-Norton - 28:14

He did get permission to talk to the lady's boss though, so there's a ball rolling on his side to keep discussions moving, which is very good. Okay.

Tucker Adams - 28:24

Honestly, this is all heartening to me because we're identifying things that I selfishly can. Can do that is actually productive. That makes me feel like we have more of a lane here because there was a. There was a version of this where I was like, what are we actually contributing to this broader picture? But even just getting all of the information in the same place and building on the KMZs and the shapes, etc. Is value added. Okay. Who else? Okay, I'm moving on to the enabled one, unless I'm already forgetting stuff on that front. Good to move on.

Michael Byers-Norton - 29:08

Yep, absolutely. Okay.

Tucker Adams - 29:10

On the enabled fronts, there are two kind of major columns to it. There was the enabled. If were going to use you for a, you know, densification slash, general engineering assessment on individual sites, and that would only be applicable for deals where we are doing a lot more diligence. Right.

Michael Byers-Norton - 29:38

Yeah.

Tucker Adams - 29:38

I say that in contrast to the one that were just discussing, where triple points buyers would presumably be doing the kind of engineering diligence on their. On their side. Right?

Michael Byers-Norton - 29:50

Correct.

Tucker Adams - 29:51

Yep. Okay. So in the case that we are doing more diligence, whether because we expect to own them ourselves or because that's just the shape of the transaction based on who a buyer would be, we got a range from them. They said 50 for the first tier, 100 for the second tier of their work per site. Right.

Michael Byers-Norton - 30:12

I think it was 50 for the second tier and 100 for the third tier.

Tucker Adams - 30:17

Yeah, yeah, yeah. Maybe the free one was tier zero in my head.

Michael Byers-Norton - 30:23

Yep, exactly. Okay, so, yeah, but we're nailing it. 100, Right? Two tiers, 50k. 100K is the rule of thumb right now.

Tucker Adams - 30:30

Clear there. I think which of those we use, once again, depends on that. Like deal shape.

Michael Byers-Norton - 30:36

Yes.

Tucker Adams - 30:40

Additionally, we talked about getting access to carriers. My what I heard in that meeting was they are open to having carrier conversations if we have a clearer vision of what the transaction would be. Which I think, as I say it out loud, overlaps with the first ramble that I had, the first conversation that you and I had here with just being more buttoned up with a data room probably having a guess about the number of sites that we're trying to transact. Maybe bringing them. Maybe I'll defer to you here. I started to say bringing those carriers more information about who the ultimate buyer would be. Although that may open us up to the risk of them doing kind of a roundabout.

Michael Byers-Norton - 31:35

Yeah, we deal with that later if we need to. Like, we can always bring in triple point because they're a very credentialized name.

Tucker Adams - 31:42

Yeah.

Michael Byers-Norton - 31:42

So, like, I don't think we stress that our initial pitch, like it's. If we have to think about it from how the carriers are dealing with these challenges. That goes back to your what is their economic incentive question.

Tucker Adams - 31:53

Right.

Michael Byers-Norton - 31:53

I know at a high level it's moving having these as a capital item on their books to an OPEX or straight divestiture. That's just, I believe, the fundamental goal. I don't quite remember why that's such a crucial thing, but I do know it's a capex versus OPEX discussion always at the end of the day from my previous experience doing cloud and colo work, but if I'm pitching this to carriers, it's like, hey, guys, we have an opportunity here to take sites off of your lists. You know, help you divest these sites appropriately and move those into Our, you know, edge focus platform. And we have the ability to help you with sites that you still need to maintain a presence in, but you're looking to divest from an ownership perspective.

Michael Byers-Norton - 32:40

So we have the ability to sale, lease back those type of sites or just keep it as a triple net lease type of sites. But then we also have the option to just take fully divested sites off of your books 100%. Our job is to help you assess those accordingly and take on that burden ourselves. So helping you make those good decisions. So give us the data if you already have sites identified or if you're needing to review the sites that you have to understand what a good strategic densification play is, we can talk to our partners and put together a solution for you. But our goal is to make this an easier way for you to exit these sites appropriately and have that strategic option to be able to stay active in them to accomplish that goal. And I think that's the pitch.

Michael Byers-Norton - 33:20

I mean, it's a fundamental. Yeah, we're happy to help you get these off your books and make sure we're helping the teams that do need to stay active.

Tucker Adams - 33:29

And that pitch, that role that we just described from the perspective of the carrier is the same whether we expect to be the ones owning them long term or if we expect to just be enabling a transaction to someone else who will own them. As far as the carrier is concerned, the face that we present to them is we will help you sell sites to someone who's ultimately going to use this as a data center. Could be us.

Michael Byers-Norton - 34:06

We just know that the. We know the highest and best use for these sites. Yeah. Supporting digital infrastructure. We want to keep avoiding the term data center. Okay. Just because that does eventually lead to community pushback and zoning. Pushback.

Tucker Adams - 34:20

Yes.

Michael Byers-Norton - 34:20

For identifying a network node. It's not a problem. Like it's something that I came up with. Exactly. So it's just like now we're highest and best use for a strategic network site and we're happy to get these off your books and take that on because we're representing, you know, significant capital investment who wants to be able to own and operate the site. And you know, we have those options to keep this as a triple net lease if needed or help you consolidate down into a normal traditional type of lease and you know, dollar per kilowatt or dollar per square foot manner within the facility that we own and operate. We can do either.

Michael Byers-Norton - 34:57

Our whole goal here is to not make this a burden upon you because we just are in A situation where we're looking for sites to be able to put to work and have the capital backing to build and move on this right now.

Tucker Adams - 35:07

And when you're talking about lease structures, this is operating under the assumption that at least some of these sites will have carrier equipment that they want to keep on.

Michael Byers-Norton - 35:18

That's. Yeah, that's, I think the dingle that we probably should be stressing more. So I'm talking to Fireflies as much as you right now too. Yeah, like if I'm. If I'm in the shoes of a product manager at a carrier location and I want to have as many cards I can do at my fingertips, they have a program that they already do where they know I can deploy more equipment at this location or I can take down more fiber strands or more conduit at a location that their internal pricing tools run around.

Michael Byers-Norton - 35:43

And so if we're like keeping this gentle, saying, hey guys, you can keep this as a potential network node for future deployments of new year, next generation of equipment, or future fiber builds, like we're happy to pre allocate that capacity for your future rider first refusals or your future capacity to lease and build. So we're not removing this from a strategic tool of your Rolodex because we just want to own and operate this. And we're happy to keep you with the access to the facility as a lease basis or as a traditional taking down shared space in the central office business. And we need to find the right term there for carrier language. Again, trying to avoid using data center. Maybe we do have to say colocation, but it's digital infrastructure.

Tucker Adams - 36:23

Sounded good to me.

Michael Byers-Norton - 36:25

Yeah, it fits our name pretty nicely. Right.

Tucker Adams - 36:27

So everything is digital infrastructure.

Michael Byers-Norton - 36:30

Yep. Because that doesn't mean everything and anything. That's what I'm saying. Yep. And so I think it's. If we can throw together that fundamental pitch, just saying, hey guys, like, the need for these type of deployments is crucially growing to support the next generation of digital infrastructure and application workloads. And we're happy to get these off of your books right now while keeping them active as a site so you have maximum flexibility for future use of this location. But most importantly, if you're trying to divest or spin down the workloads in those locations, this is the perfect structure for you to do so. And we're doing this with recognized groups, you know, from a very large capital perspective.

Michael Byers-Norton - 37:06

And we're looking at, you know, trying to properly maintain the current services of these locations and further augment and densify them to host future digital infrastructure.

Tucker Adams - 37:17

I do think. Go ahead.

Michael Byers-Norton - 37:19

Sorry,.

Tucker Adams - 37:22

I was gonna say, given that and I can't. I think it was Verizon that had announcement. But like the big carriers know that this is a thing like I think it was Verizon basically said that they were gonna, you know, create a program to turn some of their central offices into data center capacity. Right. So I think they're probably handling that on their own. There's less of an opportunity for us there versus maybe a lumen like whoever it is, I think smaller carriers are probably better opportunity for us as a small shop to be the expertise and be the help for them to make this happen. Whereas Verizon is more likely to say we have the people internally to do that. We do not need help, not even internally.

Michael Byers-Norton - 38:10

But some other partner isn't coming into it. Yeah, we look at the Sprint when Cogent came in to do it and Cogent flipped through data center eventually too. It still gets down to what's their bucket. But you're absolutely right, the small carrier thing could be brilliant. We should definitely explore that a little bit more because it's the same technology evolution here that we're trying to go after. But if we have that as part of our pitch, like, hey, you know, we're looking at trying to, you know, enable Metro meshes. If we want to get too detailed, this is like giving away maybe too much secret sauce or not. But, you know, we're looking for potentially your smaller sites and that's where we can start putting that criteria out there. You know, two acres minimum or 45,000 square foot building minimum.

Michael Byers-Norton - 38:48

Like we put some sort of stat out there to help them know kind of what we're targeting. Because if these previous items already in play, like the Verizon making that public announcement, they're probably chasing 25 megawatt and above sites. They're not doing the smaller play that is that emerging market right now. Now, I could be wrong there. When Google announced they're supporting half racks in people's houses, that could have triggered some thoughts. That's crazy. You and I are. Oh, that's right. On the economics of it's not great, but it highlights again, that's where the market's going. Like that's my total cost of ownership spiel. It's a brain neuron. We're. We have small neurons at the fringes. Like it's. It's going to happen the same way. But it's a.

Michael Byers-Norton - 39:29

It really just says get back to that same concept of these are carriers, they make money on network, they don't make money on real estate and data centers. So no matter what there's going to be always a shift in this area of divesting assets they had to previously acquire and develop for a network product in the past. If that is no longer part of their strategic goals for that site or for that product or for their just their purposes in general. It's signed to the best. And so that's the fundamental economic thing we're tracking here is as technology continues to improve, wavelengths approve, you know, bulk fiber continues to get more economic and data centers continue to consolidate. You know your needs for these sites might be changing.

Michael Byers-Norton - 40:11

We're here simply to offer a highest and best use platform that gets that helps you through that transition but also enables you to continue to stay active in that site for your minimum services if that is a requirement. Because that sale leaseback of select and Ilex sites is an undertone item we probably should be pulling on here. If we're talking to product, your current commitments and deals in that site can stay active, they can be unwound or if you need to we can also pre allocate capacity for you to further densify and move in and we want to be gentle on that use right at first refusal language so we don't have to but we're prepared to. That's stepping over my skis a little bit for the expansion but it helps a ton.

Michael Byers-Norton - 40:52

Like it really is a this can stay a site for you to do your things and you're not having to rip a band aid from impacting your services or your revenue piece. You're strictly trying to impact your cost structures and just keep that as part of our pitch.

Tucker Adams - 41:07

All that makes sense to me. I am okay I'm I more partly for Fireflies Rambles partly to run by you I'm gonna put as a to do for Tucker research what that other announced deal was and what the you know what information do we have surrounding it. Because I think that's going to be a good proof point that this opportunity is there. I think another one is research any other announced deals with facilities of this size. Because I think the a lot of people are talking about this and I don't think there are that many actual deals that have been announced but being able to point to one will be valuable as a proof point.

Tucker Adams - 41:54

Additionally researching the details, you know, if any articles have been written or anything about why specifically these carriers are trying to divest those sites and what is driving them to change capex to opex. That's another like research thing for me. Another thing that, that was mostly just for fireflies.

Michael Byers-Norton - 42:18

I think I got one I want to add to that. Let me add one more to your research thing and I can do this too but please don't let me slack on it. I remember hearing a stat previously that AT&T historically like possibly back in 70s, 60s, 80s was the largest real estate owner in North America and today they are not. At some point in time they made the financial decision to shift from owning all their network infrastructure to a different structure leasing it now. So I think there is a historical precedent like stuff that people in universities in this area would be learning about that might be helpful to understand the fundamental economic drivers for that decision. So AT&T's shift from owning to operating is something to feel out clear.

Tucker Adams - 43:06

I feel like there, I don't know if it's McDonald's or somebody else but like some fast food chain and maybe multiple fast food chains are also among the biggest landowners in the US and that's like a big driver for private equity transactions around them is they're pretty much just buying the land under these things. That's a total random ramble back on thinking.

Michael Byers-Norton - 43:28

Right. Like remembering that Triple Point is a venture capital investment group that doesn't have experience in data centers. They have experience. Exactly what you just talked about.

Tucker Adams - 43:36

Yeah.

Michael Byers-Norton - 43:37

So it's like that's kind of think what's going to come out of this is. Yeah, there's a data center play here too, but there's just straight up an asset management play as well. Yeah, this is an emerging market for just traditional asset managers. Same pitch. If we need to have a small operation empty to keep the carriers happy to divest. Great, let's put that together. But it might just be straight up a land play. At the end of the day. Knowing the need for what you call entitled land for new capacity output. This, this is thesis driving us right now. Digital infrastructure densification for pre entitled land.

Michael Byers-Norton - 44:11

Making sure we stay within the bounds of the site zoning and the power that site can handle should enable us to build natural mesh capacity at the edge to handle inferencing and AI workloads that are unable to find that type of

compute today from a backfill perspective because the utilities can't afford to overbuild new transmission generation. The highest and best use of these sites pre entitled pre powered and pre interconnected is thesis that New Edge Co is going after.

Tucker Adams - 44:40

Or for me I honestly thought that was a completely unrelated ramble but glad that it came back around.

Michael Byers-Norton - 44:48

Okay.

Tucker Adams - 44:49

Last last thought that I had before I lose it is for enabled. They are our line to two separate parties. There are line to the carriers which is what we've been describing so far. They also explicitly said that they have aligned to family offices that are interested in this space. I think we need to go through the next steps of what we owe enabled in order for them to kind of push us forward with both of those parties. And I wonder if it's something as. As basic as like basically just like an a memo to them for this first step that says basically everything that you said on the call today kind of the vision of what we will be doing. The I think you could potentially have different versions of this that face the investors or face the carriers.

Tucker Adams - 45:51

But let's just think about the carriers for right now. You would say like our value prop will include, you know, who we are basically your background and expertise plus my horsepower and automation. Let's say whatever. Like what are we going to do for them that enables them to move these sites which is the stuff that were talking about at the beginning of this call in large part but also the you know we're gonna have a line to commercial offtake. We've supported getting these deals done. We've supported the land assessment etc. Right. Like what are we gonna. What are we bringing to the table that's going to let them move their sites? I guess what is the. It's tough to get to the like what is the broad shape of like what is the upside to them?

Tucker Adams - 46:46

Like how much money do they get when we don't know what their site profile looks like. Right.

Michael Byers-Norton - 46:54

They're just getting divestiture sites. Like we don't need to pitch the financial piece of carriers. Yeah. Something they had to do.

Tucker Adams - 47:01

Oh sorry.

Michael Byers-Norton - 47:04

Good.

Tucker Adams - 47:04

I was just gonna say like what are your thoughts on the next step between us and enabled being basically just writing down the conversation that we had today slash the conversation that you and I are having right now and like making sure that they, you know have their arms around what we're discussing here and then we can end that or in addition to that memo of what the plan is we can ask them like what else do you need from us to push these forward? Like they basically said we need to define this opportunity or I think we could again like this is a fully open question to you but do you think we gave them this memo writing everything down?

Tucker Adams - 47:56

We could Then turn it around and say like what do you need from us to be able to take the next step with the carriers?

Michael Byers-Norton - 48:03

Yeah. So I think there's a couple pronged approaches we need to take with enabled. Right. There's the what you're talking about to get the carrier discussion going. So putting together an example pitch, the value prop and then if we're manipulating things since these are enabled, opening doors, keeping enabled as part of the facility assessment dynamic for this engagement. Right. So like keep them heavily involved there so they're at least this goes against now leo's budget for business development. We're not reinventing wheels here at the moment. Yeah. So I think that's crucial there. What we next need to figure out is what we're trying to do as an entity regarding enabled and their family office. Because that's going to be one type of approach where hey, who are you? Well,

we're enabled with this group that's going to be doing these things.

Michael Byers-Norton - 48:48

Like I think that's something we need to be thinking about and the reason we need to think about that is if we go a different route here and we learn from the pitch that I've been seeing Triple Point do lately. It's a. Hey, you know we are backed by an Alumni ventures investment fund. This is the number one venture capital investment group in AI according to PitchBook this year. Here's the record and they are backed by two. They're specifically doing these sites to be able to take care of two of the largest edge deployment companies in the world. One backed by Nvidia and one backed by amd. This is a very capital real project. We're not a bunch of wildcatters trying to chase this thing.

Michael Byers-Norton - 49:29

But that's like if we're pulling in a new edge co funded by Triple Point entity to do this, that's how that pitch would look and it would have a very different ability to get to the executive layer incredibly quickly because it would come in through one of my ventures networking connections to be able to start having sit downs top down. Whereas I think if we're doing the enabled energy approach where we're trying to build it around their investors and their name, that would be more of the bottom up. To enable those current relationships. Enabled has to open those doors. Now I don't know if the investors have to figure into that, but that is just kind of the ramble I'm trying to get out of my head coherently here.

Tucker Adams - 50:09

So I think if I'm understanding you correctly, I'm thinking about it Separately. So when you're talking about the Triple Point and alumni group as the investors and we're talking about that in the context of our relationship with Enabled, the deal there would be. And correct me if I'm wrong, actually let me ramble first and then you can correct me if I'm wrong. The potential deal shape there would be the off taker. At least the investment is coming from the Triple Point guys. Enabled is a way for us to get in touch with the carriers of the supply. That is probably one where the deal shape would be us investing individual sites with the expectation that we would buy, develop and flip them. So that's like one deal. And in that sense enabled is just the way we get to the carriers.

Tucker Adams - 51:12

I was also thinking about it as if Enabled has aligned to different potential invest. Unless we are, you know, so positive that Triple Point is going to be those guys. I think we could pull on that thread in parallel and try to at least, you know, have some kind of conversation with the investor. The family offices that Enabled has aligned to, which is a different deal. That would be. Yes, I guess the deal shape could be potentially the same of the sense of we're getting money from someone, we're buying a few sites, developing them and flipping them. The source is still likely the carriers. But the difference is instead of Triple Point being the investors, instead it would be Enabled's contacts being the investors.

Michael Byers-Norton - 52:04

Right. I think you just nailed it. Yeah, yeah. We separate those into two separate programs. Yeah. Like Enabled is very there for their carriers. Right. Not pulling them into Zo or AT&T or Unity. Right. Yeah, we keep that flexible. We don't money those waters. But so that way if the investors want to get involved on that side, if they do, it stays within that program of going after those enabled relationships and carriers. You're absolutely right that the Triple Point is the same structure. It's the same new edge code type of program. We put together this different sbv, different investors, different carriers.

Tucker Adams - 52:39

And I think realistically so two things you said different carriers. I think I would be surprised if Enabled were unwilling to be part of a deal where it still enabled carriers. But it is Triple Point investors and it correct me if I'm wrong, I would be surprised if Enabled was basically taking the position will only, you know, facilitate access to the carriers. If you also facilitate or you know, you use our investors, do you agree with that they would be fine?

Michael Byers-Norton - 53:21

Yeah, like the family office thing is a. We should just treat as a bogey, maybe not over engineer that right now.

Tucker Adams - 53:28

Difference Avenue. And I think honestly we kind of have to keep as many balls in the air as possible until one of them turns into something. Right. Like I wouldn't say no to the enabled family offices unless I was really sure that the Triple Point guys were going to come through with what we wanted them to. Right.

Michael Byers-Norton - 53:54

Yep. No, I think you're right. So if we look at it from a high level perspective. And again I'm just brainstorming here with you Fireflies. Right. We have a pitch coming together of the value prop to the carrier side of the coin.

Tucker Adams - 54:06

Yep.

Michael Byers-Norton - 54:07

And we believe that we can put the program together to deliver on that effort. We need to have the terabyte system in place to be able to do assessments effectively. Yeah. Especially on the commercial potential side of it. Just to make sure these are good decisions. If we are going to try to take control and owner operate versus just flip. And then those are kind of coming together because in real time. Because if we have that ability to put the models together of what we think this will be. Now we're putting the model together for New Edge Go. And that is where the reflection moment is crucial here. Are we going to go start raising funds for this now?

Michael Byers-Norton - 54:43

Like do we want to be having this as a sit down in a week from now when I'm sitting down for dinner with Triple Point? Hey guys, we got this machine moving. Here's the pitch that we're using to go after these bigger carrier accounts. Here is our business case for what we think we need to raise wise from a timeline and returns perspective. High level. And this is separate from that bigger portfolio play which is still floating around as well. Or we make it the same thing. We have to figure that piece out as well. But the time to start thinking about what we want this to be is now. It feels like I need to start making decisions there besides me doing my normal. Now. Let's figure it out. Don't worry about it.

Tucker Adams - 55:22

One kind of counterpoint that I have is. Trying to think about the right way to phrase it. Like I think raising is more likely. Like successfully raising is more likely if we have something that investor wants to buy. Right. It's more likely that we're going to raise for a specific deal slash transaction than just like yo guys, trust this. And so I think the pitch probably varies, could vary by who we're asking for money from. And I think the kind of various deal threads that we have discussed could be kind of where we start and how we structure this work, right? Like start with the deal and then let the deal instruct us about who to ask money from and what deal to tie that to. You see what I'm saying?

Tucker Adams - 56:37

As opposed to just being this kind of like general idea of what we're going for. Like have each funding request be based on the shape of the deal that entity is interested in.

Michael Byers-Norton - 56:53

Makes sense. We don't need to over bake that. We already know triple points. Willing to listen.

Tucker Adams - 56:59

Yeah.

Michael Byers-Norton - 56:59

Now we know there's a family office within ENABLE that's willing to listen. And if we touch our capital markets, there's probably quite a few different groups who are willing to listen, not to mention these off takers who might be willing to fund it themselves as well. We need to go that route. I think you're right. And we don't overthink it. That's a good way to put it.

Tucker Adams - 57:14

And I think now I go back.

Michael Byers-Norton - 57:16

To it doesn't change the fact that we need our structure put together. Like we need to figure out how we're going to play those cards when the time comes. But I don't think it slows down. Get our organization here defined, you know, just on how to approach it and potentially even get some of the legal things moving forward to go control this,.

Tucker Adams - 57:34

Create a SPB that we're both 50 owners of. And I guess the, the piece that we left open was whether Greg is also a part owner of that. Like I've thought about it a little bit with basically the, that the only thing of value that I have come up with so far is the thought that potentially some of these counterparties might have legal assets that they would be willing to lend or fee out to us. But I also to some degree welcome your thoughts on like, if you're like, yo, this is just going to go better if Greg is part of it because he's worked with me on these other pieces and that's the way that I want to go. Like that is obviously a very important piece of input there as well.

Michael Byers-Norton - 58:31

I'm not fully baked on having to go that route. I just know you and I need something on our side of the fence trustwise and we can try to use Claude as a gap filler there and But Greg is super useful. Greg's part of the terabyte family. Like he's positioned to be very helpful in that realm. But it is a, you know, cost benefit scenario that way. A lot of his contracts are written from a ton of experience in development, so they're very Lengthy and pedantic. And that has caused challenges before with getting things done.

Tucker Adams - 59:03

Interesting.

Michael Byers-Norton - 59:03

Efficiently and effectively. Yeah, but that is a legal. That's me as a sales guy saying that. Because the sales guys always. Legal step anyway. Right.

Tucker Adams - 59:10

Yeah. It's kind of legal in general, so.

Michael Byers-Norton - 59:13

That's just the only, like, caution I have on it. But we gotta think about it. Right? We gotta figure it out too.

Tucker Adams - 59:20

So I think we did. I think we have a to do, which is first, identify if there's anybody else with a ownership interest in this machine. And then second is create just a. What's the right structure at spv. Llc. Llc.

Michael Byers-Norton - 59:45

It'd be an llc. Yeah. Probably out of Delaware.

Tucker Adams - 59:48

Yep. Which.

Michael Byers-Norton - 59:50

But, yeah, go ahead. If I'm just speaking purely emotionally here, this is just 100 emotional thought, please. Chef pops up in this mix potentially, and this is again, emotional statements. Right. Because him and I kicked around this edge fusion concept ages ago. And so there is a potential to expand our efforts on that front. But I also don't know if it's adding real value in the real term. And it's also going to muddy the dynamic between 50 splitting type of moment.

Tucker Adams - 01:00:21

Yep.

Michael Byers-Norton - 01:00:21

So I'm just more pulling out that name that's out there. You know, we could be tagging it back in, but it would be immediately a commitment at that. More of a leadership layer if we needed to go that route. I gently broached the subject with him of like, dude, if this machine takes off, do we want to tap into our network relationships to open doors to all these other carriers that we have friends and family in right now? He's like, dude, not yet. Doesn't really. You gotta get the same baked more before you risk those relationships.

Tucker Adams - 01:00:47

Interesting.

Michael Byers-Norton - 01:00:48

So, okay. But at the same piece left in that vague term of like. So you're just doing that with Tucker, then? Hey, I'm like, well, yeah, like, I would not be doing this otherwise. But you can tell there was emotional background there because we tried to do this years ago, and it didn't go anywhere. So more just bring that up as a statement to get it off my. My soul than anything else, because I don't. Doesn't feel like a card to play. But at the same place, it's just an emotional statement.

Tucker Adams - 01:01:15

Appreciate it. I also appreciate your general outlook on trying to make sure that everybody is taken care of. Can we

maybe put a to do on your list to noodle for five or 10 minutes about, like, if. If Chef were part of the machine, what would his lane be? And Then we can maybe that informs where we want to go from there.

Michael Byers-Norton - 01:01:45

Yeah. But definitely on my. My list to think about because there's no easy answer. Yeah. It doesn't make a ton of sense at the moment, but you and I also haven't started grinding this yet either.

Tucker Adams - 01:01:56

Yeah.

Michael Byers-Norton - 01:01:57

So I think it goes both directions of, like, at some point in time, we will be likely having a tagging backup on this in some shape or form, period.

Tucker Adams - 01:02:05

I mean, that's legal. Is a good example problem that I would love to have.

Michael Byers-Norton - 01:02:11

So I don't know. I don't think we need it immediately necessarily. Okay. If we're going for a raise, it could be something very powerful. But it's again, like, Chef and I are drugly enough crazy at the time being too.

Tucker Adams - 01:02:21

Yeah.

Michael Byers-Norton - 01:02:22

And if there's no money flowing into this entity, I don't think we can properly enable and afford them either. So it's one of those, like, at least say that out loud. That probably is the deciding factor right now. So some people got families and bills to pay. You know, so it's weird. It's real that way. Yep. Strange concept.

Tucker Adams - 01:02:41

But.

Michael Byers-Norton - 01:02:42

All right. So that was just more getting off my head because it's just been. Hadn't chewed and processed that effectively yet.

Tucker Adams - 01:02:48

So that makes sense.

Michael Byers-Norton - 01:02:50

But yeah. No, I think we just slow down, rehash, try to build some way to stay organized on this effort. Because you start. It's starting to come together. Right. Like, we're getting for what it's moving.

Tucker Adams - 01:03:01

Started that process. But I like the version that we have discussed here better than what I have on the page.

Michael Byers-Norton - 01:03:07

Yeah. I'm not like, you know, I know the versions are going to keep evolving as we move through them. So it's like, not time wasted. I'm more meaning from, like, how do we stay organized? Like from a tracker or something perspective. Because I'm leaving.

Tucker Adams - 01:03:21

I made one, but I don't like it now that we've had this conversation.

Michael Byers-Norton - 01:03:25

Gotcha. Gotcha. So, yeah. But let me know how I can help on that front, because it's. I love creating these things and never using them. So that's why I don't want to necessarily take ownership of it. I'd like to. Yeah. Stay in line with you. So. But yeah, I mean, that's where we're sitting. Like, it feels very viable here. It feels like if we keep our three different prongs in the fire moving, the AT prong is just staying close with it. We know that one died.

Tucker Adams - 01:03:49

Yep.

Michael Byers-Norton - 01:03:50

Or it's a hard Pause. We know Unity requires us to stay close to rare side and bug him on Friday to be like hey just check in when should I bug you again. And then enabled's waiting for us to drive them which is the whole goal. That call today. I thought it went really well. They seem very interested. They presented to us actually aligns incredibly well which is fun. So it's just very interesting that.

Tucker Adams - 01:04:12

Way proactively it was also heartening.

Michael Byers-Norton - 01:04:16

Yeah and it shows that they're thinking joint venture wise too. It's not just purely driving services through them they're going to be willing to play a bigger role and they're local dude like Joe lives down the street at the moment. So it's a very. There's. There's synergies there. I don't want to get over my skis but there's definitely synergies there. But it also helps you and I keep in mind that yeah we're 50. We're still probably compressed down to 20, you know 80, 20 wise pretty quick right. So just be ready for aligning that component as. As we start to get serious if we are going up for a raise or not. And I'm trying to keep that component square and I'm not bringing any other terabyte resources yet.

Michael Byers-Norton - 01:04:55

I do need to fully rebuild this sheet because this is just initial AI slot version but I need to change this for portfolio play versus development play and then also still keep the reality of a densification is going to be twice as expensive probably than just doing a drop in power site. I am trying to meet with Bill Winstoniski on Friday next week who is my path into XTC company. He brought up to me that group like is actually a two part group. XTC Power does site audits focused on interconnecting to the current infrastructure to harness stranded power without disrupting the current facilities operations and that's how they enable capacity to then be rolled over to XTC Digital which is the one that owns and operates the modular data centers and chips. So it's a interesting type of statement there. Right.

Michael Byers-Norton - 01:05:46

Because if that's true and we partner with them, that's gone. That's gone. That's gone. Like it just gets incredibly nimble efficient and that's I think where it's you and I and new Edgeco chasing that directly. Like if we have to pull another people joint venture wise enabled wise or anybody else great. But I'm realizing from if we pull in like an all true digital to be the asset owner type of component and we pull in XTC to be the additional modular capacity user and we orchestrate the sale leaseback with the carrier. That trifecta might be super powerful right now. And so it's just a. I don't know. That's me bullshitting and getting excited as I pull back up the sheet and start bullshitting you. So.

Michael Byers-Norton - 01:06:27

But there is enough like just trying to get organized on those different fronts is something that we need to start thinking about. But I'm feeling pretty good that all the irons I have in the fire on this right now I'm touching currently and the only thing I've really avoided is you and I raising vertical capital on this because we have the potential to be connecting these buildings with dark fiber and wavelengths boxes and getting network revenue out of each of these two. And so that's the. When I designed Edge Fusion with Chef a long time ago, it was around owning the bandwidth part of this because that math is it's quarter million dollars per site to drop that box and just need a couple pairs of fiber to connect them and that's terabytes a second over multiple circuits to each other. Boom.

Michael Byers-Norton - 01:07:11

And so it's interesting like it's probably not going to apply but I'm just more saying like the crazier we want to get as we see success down this route, the more that's going to evolve into a proper longer term platform and company. So it's a super exciting that way.

Tucker Adams - 01:07:27

Love it.

Michael Byers-Norton - 01:07:29

Last item, we got to name this thing eventually here so figure that out besides new EdgeCo. Yeah there's a lot of new edges out there. I try to search that in Colorado Repository new digital infrastructure. Like I don't know, we gotta name digging in something that we should probably do a little bit more here just for fun when I get bored. But it's, it doesn't. I don't know how quiet we're gonna keep this or if this is gonna be allowed brand down the road. Like I'm not planning to pitch this at the events over the next few weeks, next few months, but we could. But that's also another item as this starts to ramp up. How much exposure do you want to get in general around this effort? Like should you be going to Yotta to meet people who are building data centers modularly?

Michael Byers-Norton - 01:08:15

Like it's. Should we be going to these network focused events to have sit down meetings with those groups? That's an obvious yes but we have to be ready for it. So it's a for this year, I think the one that you might want to keep in the background is PTC in January. So I guess next year technically. Okay, that is a shit show. But it's also awesome. But I need you to start reflecting on that before you get any new puppies or anything. Go get a puppy and just make sure you have a babysitter for it. Right. But then, yeah, just start thinking about that component of like if this does take off the way it looks like it could, how do we balance align resources for it and personal time and education wise too is an important part of that.

Michael Byers-Norton - 01:08:58

Shaking hands and kissing babies in the network space basically is what that means.

Tucker Adams - 01:09:01

Yes, exactly. No, that all sounds good.

Michael Byers-Norton - 01:09:07

ATD and pretty hard. Muddy in the waters on the Firefly.

Tucker Adams - 01:09:10

Kristen can take care of it.

Michael Byers-Norton - 01:09:11

Yeah, yeah, buddy. Well, she might want to go to PTC too, so keep that in mind as well.

Tucker Adams - 01:09:17

She's not a big data.

Michael Byers-Norton - 01:09:20

Oh yeah, it's just walk around and eat and get hammered type of thing. Is mostly events and everybody's on super low key mode. Like you and I are still gonna run around like crazy, like 30,000 steps a day minimum type of thing. But it's. Yeah, a lot of people bring their spouses because it's just, let's go chilling. Hollywood for chilling five days. Yeah, chilling. And then if you put up a data center folk, you get a lot of free dinners. You know, it's cool.

Tucker Adams - 01:09:46

Right?

Michael Byers-Norton - 01:09:48

Anyway, that's just add rambling. Anything else I can muddy the waters with here?

Tucker Adams - 01:09:52

No, I think that's everything. I think immediate next steps. I will look at the Fireflies list or you know, the Fireflies to DOS that it generates. And if there's anything that I think is missing or wrong, I'll fix it and then I'll just shoot you an email just so we know that you know what is on everybody's plate for the next couple days.

Michael Byers-Norton - 01:10:15

Okay, sounds very good.

Tucker Adams - 01:10:18

And now I'm gonna go get some lunch.

Michael Byers-Norton - 01:10:21

Yeah, I just landed a case of D in the background because I'm not nice. I got another call here in 20 minutes with. Oh, dude. Basin Co op rumor going around that they're going to cap all single user power amounts to 24.9 megawatts. And that covers like utilities from like Montana down through Iowa almost down into Texas. And it's just like there's no way. But the call I'm about to get on is of course a basin utility call. Yeah, like this industry never slows down, man.

Tucker Adams - 01:10:53

Interesting.

Michael Byers-Norton - 01:10:55

And there's no way. Right. There's no way.

Tucker Adams - 01:10:58

But, yeah, this. This part is never gonna let that happen. But. Right, because. Yeah, they're. If they're doing anything with transmission first and say. Yeah. No.

Michael Byers-Norton - 01:11:14

Yeah. And we got two more years of Trump in office in theory. So.

Tucker Adams - 01:11:17

Right.

Michael Byers-Norton - 01:11:18

There's no way forks gonna shift on this. They should be incredibly supportive of it.

Tucker Adams - 01:11:22

Yeah.

Michael Byers-Norton - 01:11:23

Yeah.

Tucker Adams - 01:11:24

All right. Good luck. Let me know how that goes.

Michael Byers-Norton - 01:11:27

All right, be safe. Talk soon.

Tucker Adams - 01:11:28

All right, I'll talk to you soon.

Michael Byers-Norton - 01:11:30

Later.

Tucker Adams - 01:11:30

LA.
