

Ansh - 00:32

Hey, everyone. How's it going? Hey, doctor. Hey, Davis.

Tucker Adams - 00:40

Hey. How are you doing?

Ansh - 00:42

I'm doing great. I'm traveling east coast to meet some clients.

Tucker Adams - 00:47

Got it. Okay. So you're pretty late in the day.

Ansh - 00:50

Yeah, yeah. Where are you guys calling out of?

Tucker Adams - 00:54

I think we're all Denver.

Ansh - 00:57

Oh, that's awesome. Nice. Hey, Michael. Can't hear you. Michael.

Tucker Adams - 01:05

And we got an input error. No sounds.

Ansh - 01:17

Yeah, I. I had to take a red eye and then drive directly to Hamptons. So, yeah, I was really tired. And then I met the client and then I slept for a few hours.

Tucker Adams - 01:28

Is the Hamptons for fun, though?

Ansh - 01:30

No, business. All business. Yeah. First time clear now?

Tucker Adams - 01:37

Yeah, yeah, we gotcha.

Ansh - 01:44

Awesome.

Michael Byers-Norton - 01:44

Sorry to interrupt introductions there. Yeah,.

Tucker Adams - 01:48

I was commiserating with Ash doing a red eye and being at the end of a relatively long day here.

Ansh - 01:56

Yeah, yeah.

Tucker Adams - 01:57

Why'd I say relatively? A very long day.

Michael Byers-Norton - 02:00

Yeah.

Ansh - 02:02

Taking a red eye tomorrow back. It sucks. But anyway, when do you leave on.

Tucker Adams - 02:10

A red eye if you're going west.

Ansh - 02:15

12.

Tucker Adams - 02:17

And land at like 3am No,.

Ansh - 02:23

I think 9 dirt.

Michael Byers-Norton - 02:27

That's a long flight. Yeah.

Ansh - 02:31

Yeah.

Michael Byers-Norton - 02:31

Brutal.

Ansh - 02:31

I'm not.

Michael Byers-Norton - 02:34

Geographer. That's brutal. But I appreciate you guys coming together here. Your timing is good. In astro, like, it's been a lot going on. This is the last time we talked in a very exciting way. But there is rapidly emerging a need to be able to take a more data driven approach to a lot of what we're trying to do. It's not the full synergy I know we can nerd out on and go down a path there, but I think that's still discussion that's brewing. But right now, for example, Tucker and I got exposed to a portfolio of 2,800 sites on Tuesday that had been thinned down to about 200 by the

broker. And so now we're going through 200 sites. And so we have two ways to do it, which is, hey, Davis, grind.

Michael Byers-Norton - 03:21

And because Davis is our lead analyst who works a lot of these early studies, but I wanted to expose the gifts that you put together to be able to see how that could be applied. Because these are smaller sites in nature, I wanted to see if I can potentially fit together that way. Like. And so can you, like, give a rundown on, like, what Myri does and you know how that can fit in to help with that exact problem?

Ansh - 03:45

Yeah. Awesome. 100. But that's 200 texts. A lot. So what we do is basically we connect eight AI agents. Like basically your cloud code, your codex, whatever you use to physical world through data enrichments, tools and signals. So we've collected everything about US locations, like 300 plus data fields about the land, the parcel information, the contact information, the power infrastructure, the fiber transmission lines, and we just don't know what exists where. We also have this formula to calculate distance, straight line distances, driving distances, everything put together in one API mcp. It basically gives your AI superpowers to make decisions. So the first vertical we sell to is of course data center site selection.

Ansh - 04:36

So we also have a platform like a UI that basically takes in your requirements, your buy box and finds you off market land deals, but also does due diligence on it. Like 100 plus field due diligence within minutes which usually takes like hours or days to put together. So that's very specialized of course. Like we have two products. One is like either you use the platform or either you just like plug into your whatever AI that you're using with just a API and then your AI will fetch every information using Mirai. And so everything is cited, everything is grounded in ground truth, so you don't have to worry about like wrong information coming through you. In this case, there are two ways we can do it.

Ansh - 05:21

Like one is like you point me towards the 200 sites, I generate a report, I generate 200 reports for you. Or either like you can just use my API and tell Claude, These are the 200 reports and this is Mirai Earth. Do all the due diligence and Claude will do it for you.

Michael Byers-Norton - 05:42

That's the power of it. Like, especially since we can play on the API layer, there's potential to be sifting into some of what we prepared automatically and potentially other platforms that we're validating with step one algorithm running on this. Which is why I wanted to pull us back together because there is just that huge potential there.

Ansh - 06:01

Yeah. Yeah, awesome. Do you, what kind of due diligence do you want to run on these 200 sets? Is it land read plus power read or there's other things also.

Michael Byers-Norton - 06:13

So like ideally I'd be able to get a snapshot of what the parcel looks like because we're just given pins on a knz or an address right now. And so what the parcel looks like is big and then any estimate you have around power would be massive. And I know that's a degree of accuracy, but that is still what we're dealing with here. The sites are already on Net, they're fiber connected sites and they're already technically powered and they're technically zoned. So it's those items are not as stressed about from a fundamental frame. But this is a step between us actually sending somebody out there to start doing physical diligence on the power the site can handle today. Already has today. And then contractual diligence where we understand how much power is on them currently. Like from a utility contract perspective.

Michael Byers-Norton - 07:02

And then who can we talk to on the local utility to densify it? So I don't think you're capturing that full stack, but I'm very curious if you are, because that's essentially the dream of what we're trying to take together right now in this high volume perspective.

Ansh - 07:16

Makes sense. Which state is it, which county?

Michael Byers-Norton - 07:21

It's North America. It's like right now we have a bunch in Ohio and a bunch in Iowa.

Ansh - 07:28

Okay, awesome. Yeah, we do have an estimate as you mentioned. We also have the whole power read different things, but you would have to get that done. The second part of the thing for sure. Yeah.

Tucker Adams - 07:42

Sorry if this is asking you to repeat yourself, but where are you getting the data on power or I don't know, some of the other fields that Michael's describing.

Ansh - 07:53

Yeah, let me share my screen. So it'll come with the source itself. Can you see my screen?

Michael Byers-Norton - 08:02

Yes, sir.

Ansh - 08:07

So power is of course a screening estimate, which is our research formula. But like so the nearest transmission line comes from EAI and HI fld. Then we have county level interconnection queues, we have nearest power plant coming from eia and then we have grid upgrades which we fetch as well. And one more example, I guess. Yeah, similar. Yeah. If there's a nearby substation we would find that as well. And this screening is based on different things. Like it's based on topography, it's based on some more data that we collect. I wouldn't say like it's proprietary, but it is definitely multi tenant paid data that we collect. And then we formulate this estimate. So it's not something that you like. It's federally available data that we consider. We consider more things into it.

Michael Byers-Norton - 09:10

Gotcha.

Tucker Adams - 09:11

Thank you.

Ansh - 09:12

Of course.

Michael Byers-Norton - 09:14

And that's what I think triggered a lot of our thoughts last time. It's just looking at that estimate for power dynamics, like how much could be available. And that's like Tucker and I have talked. That's how we got to really bond with each other initially was similar algorithm thoughts and VCCs on how we could, you know, optimize infrastructure for these sites. And so that's like one of those, I think having that information from what you're producing and then figuring out how to augment it or pull in extra data is what we will be doing on our side with it. So from a branding perspective or from a licensing perspective, like if we're doing a review for a site, like a client comes to hires terabyte to do our review and we're hitting different elements than what Myri does.

Michael Byers-Norton - 09:55

But if were adding that to our mix. So like, so every site that were doing, we also ran a Myri. Like, how are you navigating those type of situations today? Because it's. I'm not really like reselling your data because we're doing a lot of the same work, but I can be augmenting our offer with that.

Ansh - 10:11

Like, yeah, I think that is definitely possible. Of course you would need like a licensing deal with us. It depends on like the price depends on your consumption. It becomes. It highly depends on like, are you making 200 or 2,000 calls? Right. Or like 20,000 calls. And, and usually when it comes to these, like not reselling but productionizing our data, we'll try to like do like a little longer contract. So like six months ideally. But we would give you like a pilot. Of course you can. If it does not work well, you walk out in the first month or like in first two months, if it doesn't work out, like for any reason, you can walk out from that deal.

Michael Byers-Norton - 10:53

And so is there a route there? We'd be like almost like reselling that review, working. Keep it branded my rye and just include that in our package deliverable to a client. Or is it more like it'd best to like license the IP and then roll that into our presentations that we deliver. Like, have you thought about that resale aspect?

Ansh - 11:11

We haven't because no one has asked us that. Usually people would just branded us themselves because they're paying for it. Yeah, yeah, it's up to you. I mean, if you want to like put it as my guide, like, it's up to you. Or if you want to rebrand it's up to you.

Michael Byers-Norton - 11:26

I explore that idea of like the fun piece of, hey, don't believe what I'm saying. Check out what my eyes saying too.

Ansh - 11:33

Like, I.

Michael Byers-Norton - 11:34

That was one of those interesting thoughts when I was first looking at those synergies there and could be cool.

Tucker Adams - 11:40

Yeah,.

Michael Byers-Norton - 11:43

Okay, well, that's what I wanted to sink on. Like it's. That's fundamentally it.

Tucker Adams - 11:50

Right.

Michael Byers-Norton - 11:50

There's so much more we can start poking at from an optimization perspective. But that's so much of what we're working on IP wise as well. And so I want to be very conscious of, you know, protecting everyone's efforts that way. But just from an efficiency improvement, it's super fascinating of the potential. And that's where if we get one of these opportunities that's floating up right now, I think that'll be the launch point for our first subscription because I still see an efficiency gain there for gotta go from 200 to 20 and then at 20 sites is where our normal machine takes over. So I think that would be an internal use of the product more than it would be for repurposing information.

Michael Byers-Norton - 12:26

But as we continue to, you know, flush out our own product from what we're calling foundations from a just repeatability perspective, I still think there's something interesting there of just having a section that is the Myri AI review and just keep it as like that kind of like. No, dude, this is. We're using the machines that are out there. We're using agentic pieces. Here's review. And I don't feel comfortable really rebranding that necessarily. So I'd like to find a way to keep that in a way that keeps you front and center on that piece because it's a lot of data you're putting together and a lot of feedback.

Tucker Adams - 12:59

So have you all talked pricing already?

Ansh - 13:04

Yeah, no, we haven't.

Tucker Adams - 13:05

No.

Ansh - 13:06

I, I spoke pricing with Patrick who didn't end up signing or replying to me ever. I don't know where he went.

Michael Byers-Norton - 13:14

Dude. He's busy as all heck right now.

Tucker Adams - 13:17

So yeah, everybody's scrambling. I was just gonna ask like maybe this is a conversation for another time and so that's fine. Just like directionally trying to get an idea of. Let's say that we're the order of magnitude that we're talking about is we have 20 sites or whatever. Let's leave it wide. Let's say we have 50 sites that we're trying to get this information in terms of parcel size, power availability, nearest power infrastructure, the fields that you were describing. Can you give us a directional idea of what that kind of access would cost?

Ansh - 13:59

Yeah, sure.

Tucker Adams - 13:59

And sorry if I'm stepping on your toes, Michael.

Michael Byers-Norton - 14:02

No, that's next step. It was proper. Appreciate it.

Ansh - 14:06

So if you consider if you it like our pricing based is credit based consumption. So it depends on which APIs you're calling but let me run a quick math on it. Since you said you need parcel information. That's.

Tucker Adams - 14:23

And that can totally be like a, an offline Or a quick update later if it's not expecting you to have it just off the dome.

Ansh - 14:33

Yeah, seems like from off my head, I would say it'll cost you somewhere between 750 to thousand dollars a month or maybe 500 to 750amonth.

Tucker Adams - 14:48

For like the volume of calls that we're describing. Basically, yeah.

Ansh - 14:51

Yeah. Okay. 100%. Need to double check this, man. And it also depends on the. How much data you like fetching as well. Like.

Tucker Adams - 15:01

Okay, makes sense. I think it's like not a. Not a gotcha at all. Just trying to figure out the order of magnitude that we're working in. Okay. I might. I think homework for me is to. And sorry for coming in a step later here. So I think my own homework is to poke around a little bit more and see what kind of fields we would be looking at. Yeah, sorry, I do more of that homework previously. I appreciate you walking through it though.

Ansh - 15:29

I assume you're technical.

Tucker Adams - 15:32

Yeah, depends who else is in the room. It's a spectrum, you know.

Ansh - 15:38

Okay, so it's very simple. Do you cloud code or do you use Codex? Yeah, yeah.

Tucker Adams - 15:45

At this point it's only cloud coding. There was a time when I wrote a little bit of stuff myself.

Ansh - 15:50

Yeah. So all you have to do is copy this. I'll send you the doc.

Tucker Adams - 15:54

Okay.

Ansh - 15:57

It'll make you log in. So it'll make you log in here on mirai.com and once you log in, it'll just generate like an authentication code on its own and boom, you're all set to go like. It's like literally just like one copy paste and then sign in, sign up for your case and then come back.

Tucker Adams - 16:15

I see.

Ansh - 16:16

Yeah. You have like everyone has 5,000 free credits to start with, so you able to start without paying anything for

now, just so that you can check everything. And then I'll send you this small file that you just copy paste to Claude and it'll understand everything about how to do. And then you can just start fetching data in the API references. You will see this field catalog. I'll send this as well. This has every field that we have. It's like around 300 fields, but you don't need to read it because there's also this API called Meta Fields. If Claude will use this, it always is instructed to do. It will get to know all the fields that we have.

Ansh - 16:57

Okay, so once Claude knows what is there like then you can just poke at it and just ask Claude that, hey, does an has this, does un have that? And then we Also have this lookup API which is parcel lookup. So you just either give us like a lat long or. Or address and then we basically fetch everything for you about it. This is like 300k. It comes back with all the county market information, all the parcel information, the geometry of the parcel. So then you can draw shapes on the map as well and yeah, flood zones, elevations, state, county. Yeah so.

Ansh - 17:42

So this is very helpful because in a single call like you can know everything about the parcel and the county and the zoning and etc and then we have this proximity API and I'm not sure if you guys have any use but if you need to calculate distance, like if you care about distance to the nearest X, nearest airport, nearest highway, nearest something, then you can use this. But again like usually Claude is very smart. Like all you have to do is. Can. Can Mireye do this? If yes, just do it and it'll me right. So you don't have to like know what APIs you have. You just have to prompt cloud and then fetch is the main one which helps you fetch all the data for any lat long or an address. And we also have a preset to make your life easier.

Ansh - 18:29

So site selection is a preset, so everything you would care about selecting a slide site is a preset. So you just call the preset and it'll fetch everything. And then we also have utilities of course if you want to know things about utilities and yeah data center setting. So you just call data center setting field and preset and everything you care about. Data centers will return. It's like 70, 80 fields.

Tucker Adams - 18:59

Appropriate to understand that lookup is kind of higher level defining information and fetches. Yeah, your. Your layers on top of that. Cool.

Ansh - 19:11

Yeah. And yeah so fetch with presets would be like the easiest. Like if you care about natural hazards, just call natural hazards. If you call care about grid. We don't give a power estimate like this because of course it's a secret formula for now but I'll.

Tucker Adams - 19:31

Sorry.

Michael Byers-Norton - 19:31

Which.

Ansh - 19:32

Don't give up which one power estimate through our API because IPS are cheap. But if you sign that contract we'll give you a separate API which will calculate power estimates and it'll also help you find contact information of the parcel because that is also something that we have built internally because finding off market owners is really hard. I'm not sure if you guys require that or not though.

Michael Byers-Norton - 19:55

No, I, I want that. Like if you can help me find out who to talk to on the local utility side. Like that's incredibly helpful.

Ansh - 20:02

So.

Michael Byers-Norton - 20:03

Yeah, yeah.

Ansh - 20:04

So that's timely. Yeah. So there's more that we have, which is not on the docs, which we sell only as a contract, but most of the fields are there. Like another strong thing is like every field that we return, it comes with the citation as well. So you know that where are we getting it from? And a confidence board as well.

Michael Byers-Norton - 20:26

No, I mean, so if we were going to give this a test run, like how do we do that? Like, is there like a one month description that we can jump into? Like what's the best way for us to start playing around in there?

Ansh - 20:35

5,000 Credits are for free. And then for \$99 you can get 15,000 credits. Just, I would just say use that till you figure out like how well it works and everything. And once you're happy with that and once you want to sign a contract, then we'll put in together like the power estimate and contact information and anything else as well. Like, feel free to like tell me this is missing and I'll go ahead and get that for you as well.

Michael Byers-Norton - 21:03

Like 1, you said 99 or 199.

Tucker Adams - 21:05

Is 99 for 15,000 tokens.

Michael Byers-Norton - 21:08

Yeah.

Tucker Adams - 21:09

Which is the equivalent of what, 500 sites worth of high level data.

Ansh - 21:15

Yeah, yeah.

Tucker Adams - 21:17

And then you said, or 300 sites of. You said the more detailed polls were more like 500 credits. A poll.

Ansh - 21:24

Yeah. So 300 is just the parcel lookup. And then if you're probably doing like 100 more data fields, then it's like 400 tokens per second.

Michael Byers-Norton - 21:36

So I was gonna do like all the utility, the data center and the parcel lookup, would that get near a thousand? Like how many am I burning through if I run those in general, don't even exact numbers.

Ansh - 21:46

Is trying to get less than thousand. I would say like 700ish. I would say 700 car. Yeah. Per site. And then because you said 50 sites. Right?

Tucker Adams - 22:04

Yeah.

Ansh - 22:04

So that's around credits.

Michael Byers-Norton - 22:07

Yeah. The numbers will scale really quickly. Like that's. So for example, like the 200 I got this morning, I just drank a cup of coffee and manually visibly filtered through to build a stack of 50 that were interesting. And so I'd be loading those 50 into the machine to save it because I'm super sensitive on neighborhoods and just like the vibe of would this be a data center? And we'll get sites that are great but right next to a school and a church and how like not interested. So if I can. If it wasn't a huge amount more expensive just to run all 2,000 through. That's what I would play with.

Michael Byers-Norton - 22:38

But then I need to see an example of like how that data gets output so I can learn how to parse and filter through that or beg Tucker to build a software to make it easier to filter through all those type of moments. So it's like, that's why I think if we had something to play around with here to start with, it would be enough for us to get in trouble. And it's interesting to think about.

Ansh - 22:56

So awesome. Yeah, I think this is a great use case for what I've built, honestly, like, instead of me, like most of the deals I've signed is them like not knowing how to use AI. So I have to create a platform and it's so much legwork. I would rather just have people use my API and they. Yeah, yeah, they can do so much more cool things. Like you mentioned it, just create your whole pipeline and then a part of it instead of Mireye being the only thing. Like, I think that excites me a lot more.

Michael Byers-Norton - 23:27

Yeah, dude, partner with somebody you can build custom things with. So somebody can just hire for an hourly to build a custom. Because when you go to these first trade shows, you'll see the opportunity for dumbing things down for people is very valuable. So even though it's a huge pain to do manually, so don't do it manually, but keep a pulse on that, man. Like, keep a pulse on that big time.

Tucker Adams - 23:49

This feels like every engineer who ever makes a software tool and it's like, yo, if I could just talk to other engineers all the time, they could use my stuff. That would be sick. And then it's like, oh, there's a lot of people who aren't engineers who I have to talk to anyway. No, this looks cool though. I'm definitely going to poke around in it and I

guess Michael can just send on the. Like you said you were going to send a link to what we need to paste in to get into like build our accounts.

Michael Byers-Norton - 24:21

Yeah, yeah, let's get a month going so we can mess on it. Like, happy to get in there so we can start working on it.

Ansh - 24:27

Yes. 100. I'll send you an email right after this. I'm also like doing this thing where I fly around with my plans. I'm happy to come down one day, like just help you set up the whole thing. So if you guys are free next week, I would love to come and just help you with whatever. I'm sure you can Figure it out. But like if there's any other integrations, any other things like happy to just meet you guys as well. Like if not work.

Michael Byers-Norton - 24:51

Yeah, appreciate that.

Tucker Adams - 24:53

I have to try between now and then so that I can at least have like made some attempt and know what I'm talking about.

Michael Byers-Norton - 25:02

We'll have to definitely find time for that proper. But let us get in there and break some things and then see what we can get in trouble on.

Ansh - 25:10

Perfect. Yeah. Cool. And then can. Can I put a check in for next week to see how it's going? And then also like the power would be like when you sign the contract. So like then we can talk about contract and the power and contact information.

Michael Byers-Norton - 25:25

I'm happy to get moving on the intake as soon as you're comfortable with it. Like what do we need to do to get into there to poke around. If that's a short term contract or a month to month contract, you know, happy to get that moving on the 15,000 and once we burn through that we need to move into a different form. Very happy to help there too. But whatever the next steps are, guide us that way because we have enough floating around that we can have some fun in there.

Ansh - 25:47

Yeah, go ahead. Do you want to say something around too?

Tucker Adams - 25:53

I'll lean on Michael to send it my way when you'll have it set up.

Ansh - 25:58

Yeah. So I was going to say should I get that ruling based on 200 sites for now for the first month, assume that 200 up sites a month.

Tucker Adams - 26:11

How is that different than us signing up for 15,000 credits and then poking around? I think that's like. Mike, you seem to be nodding. My assumption would be that would be the first step is just get the 15000 credits and you know, see what we will use it for and then we can make a more. Have a more informed discuss. Like here is the ideal way forward.

Ansh - 26:36

Yeah, 100% like I'm 100% there that you should use the 15,000 first. But like that doesn't have like all the special skills like the. All the special information that we have. So I was asking more on that sense.

Michael Byers-Norton - 26:48

Like okay, yeah, if we wanted access to all toys, like what is that test period there? What is that initial contract?

Ansh - 26:58

Yeah, that's based on consumption. That's why I was asking like how many targets are you going to consume per month? I was going to reverse engineer that based on how many sites you have. But if you. You can play around with it gives you a good idea of how many credits you Will require per month. And then if you can tell me that number, then I'll use that number plus the extra thing and then come up with a number.

Michael Byers-Norton - 27:19

If I had a budget of like 50 sites or. Please. Tucker.

Tucker Adams - 27:22

Yeah, I was just gonna say I. I think the way that I'm thinking about next steps at least is we still need to figure out what our workflow is in terms of like what specific screening criteria and investigation criteria we want to use. And so I think that will probably be done in conjunction with the information that you have like that's going to inform what we're trying to collect. So I think we do the intro, we figure out what information we are looking for. The one question that I had coming off of that is do you have an example output from those more specialized fields just so that we would know like this is the. It doesn't even have to be one of our sites but just like this is what it could be. You know what I mean?

Ansh - 28:09

Yeah, for sure. I can again share my screen and show you. But we have bunch of specialized ones. It highly depends on what you require. For example, some people want like buildable acres, right? Like they want to map out like out of this which acres are out of every flood and wetland so they can build on it. So just do a math on like out of 100 acres that I'm buying, like these 50 are buildable. So that is a. That is something that we do on our own. Yeah, of course. Power is like deliverable. Estimate is straight up just number. That's the output. Contact information is what you see here. Like we'll try to find out as many phones, as many emails, the name of the people. That is also something which yeah won't be available through the API but through us.

Ansh - 28:53

And then we have all the skills on Reading county friendliness. So we have a skill which will look into like moratoriums, town hall transcripts, county sentiments, other stuff. So it basically tells you like is there any issues? Like is there a deal breaker based on the county or is tax incentive for example, like is this county pushing towards having data centers or opposing it? So that is something which is special to us. Then we have. What else do we have and are.

Tucker Adams - 29:31

We able to see this kind of example output somewhere?

Ansh - 29:35

Yeah, I'll send you the whole. I usually do. I'll send you a lead which will have all that information in it. Let me see if I can pull one up right now as well.

Tucker Adams - 29:47

And also can be an offline homework thing. Yeah, yeah, I know we're already a little over, I imagine working on bedtime for you.

Ansh - 29:59

No worries. Then I'll just send you, I'll just create like an actual PDF of actual site but also like small write up of these other things that we have. Then it's on you which ones you are interested in using. All of them. So yeah, data is cheap but like skills are expensive. And then because you sign contact together, like you get something which is not that expensive but it'll be like a little longer term, like three to six months based on like your consumption.

Michael Byers-Norton - 30:28

If you can give us a quote for like say 50 sites a month just to understand what like a three month or a six month would look like for that. Just trying to think about, just help us with that math dynamic and because I know once we go through those initial pieces of data, poke around and the skills will be oh, I want to go play with those next at the moment really quickly. So yeah, good to know.

Tucker Adams - 30:49

We're looking at.

Ansh - 30:50

Yeah.

Tucker Adams - 30:51

This looks sweet though.

Ansh - 30:53

Thank you so much.

Michael Byers-Norton - 30:54

Yeah, no, again like really impressed by the work you've done, man. To get in there and play.

Ansh - 30:59

Please introduce me to more people like you. Any people that would be interested in this as well. I would highly appreciate it. But from end all the setup instructions, I'll send you the lead, the all the special skills that we have, anything I'm missing and I'll do the math and get back to you on the 50. But that won't be today, probably tomorrow or day after.

Michael Byers-Norton - 31:22

Yeah, no stress. Like we're gonna have enough here. Once we get another poke around we can seek next week too. I'm traveling in two weeks so if we're gonna meet up in person, it'll probably be a little bit further down the road. But

definitely we're all screen based people. So let us come back with a bunch of questions and dive in from there.

Ansh - 31:39

Yeah. So then it would be great if you can just give me a day for next week as well. Just, just as a check in just to see like how Duck is doing with the UPIs and then talk with other things.

Michael Byers-Norton - 31:51

Yeah, Thursday is good for me next week. So no objections there. Let's just do it.

Ansh - 31:57

Okay.

Michael Byers-Norton - 31:58

And thanks for putting up with teams, man. Sorry for that back and forth and not using the pre book app. I appreciate you juggling that with me.

Ansh - 32:04

Yeah, of course. No teams works, right?

Tucker Adams - 32:09

Hope you get to enjoy a little bit of the Hamptons while you're out there.

Ansh - 32:12

Yeah, I'm just going to say good.

Tucker Adams - 32:13

I don't know, take a walk or something.

Michael Byers-Norton - 32:15

Yeah, dude, enjoy it. Enjoy it. Enjoy it, man. Awesome. Well, really appreciate that. And we'll do this again here soon.

Ansh - 32:22

Yeah. Take care. Have a good one.

Michael Byers-Norton - 32:23

Take care.

Ansh - 32:24

Later.
